Functional Description^[1]

The CY62148DV30 is a high-performance CMOS static RAMs organized as 512K words by 8 bits. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™ (MoBL[®]) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption. The device can be put into standby mode reducing power consumption when deselected (\overline{CE} HIGH).

Writing to the device is accomplished by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight I/O pins (I/O₀ through I/O₇) is then written into the location specified on the address pins (A₀ through A₁₈).

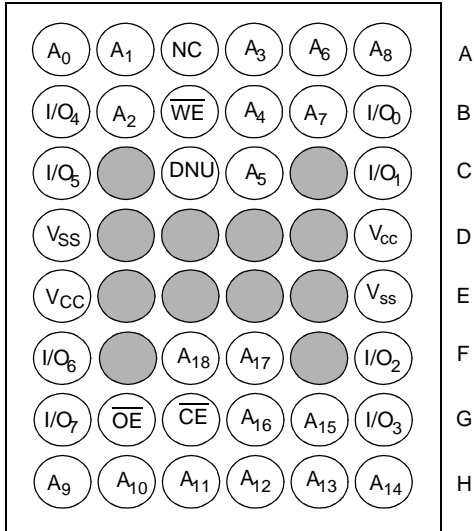

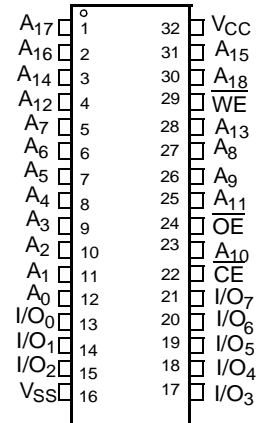

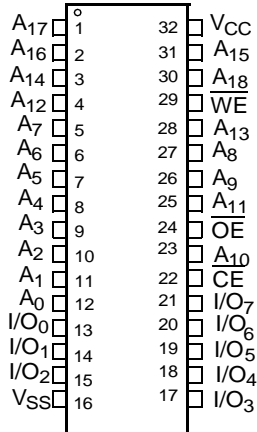

Reading from the device is accomplished by taking Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O₀ through I/O₇) are placed in a high-impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE} LOW and \overline{WE} LOW).

Switching Waveforms
Read Cycle No. 1 (Address Transition Controlled)^[14, 15]

Notes:

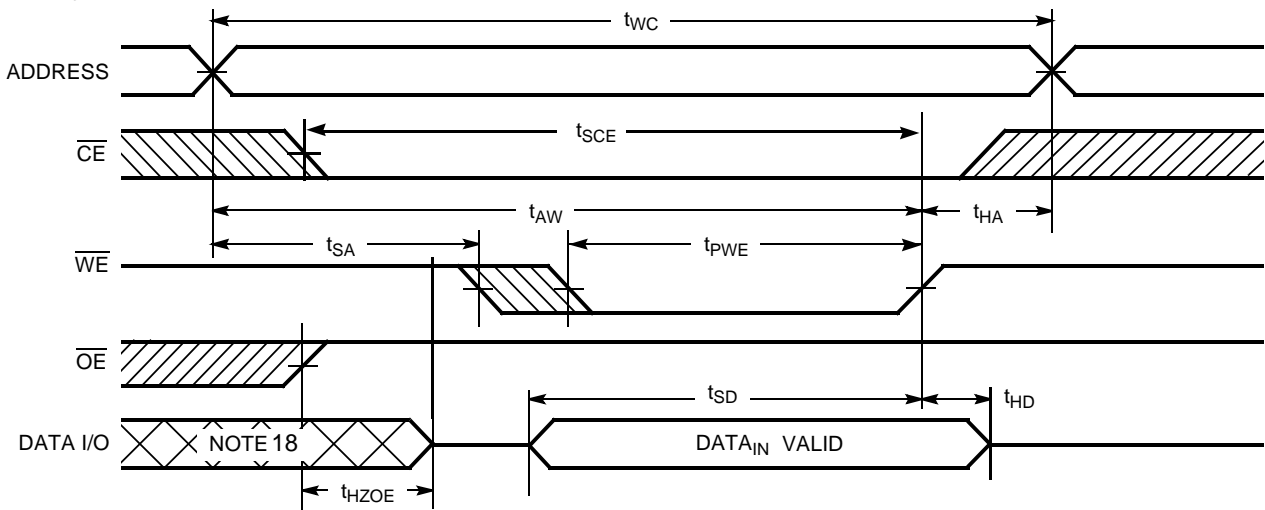

10. Test Conditions for all parameters other than three-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" section.
11. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
12. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the output enters a high impedance state.
13. The internal write time of the memory is defined by the overlap of WE, CE = V_{IL} . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.
14. Device is continuously selected. OE, CE = V_{IL} .
15. WE is HIGH for read cycle.

Switching Waveforms (continued)

Read Cycle No. 2 (\overline{OE} Controlled) [15, 16]

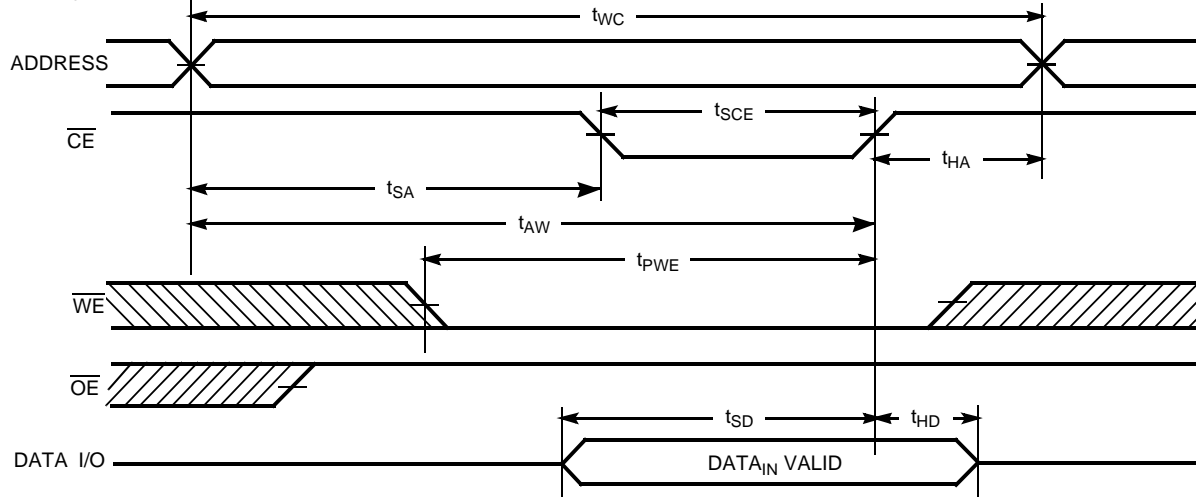

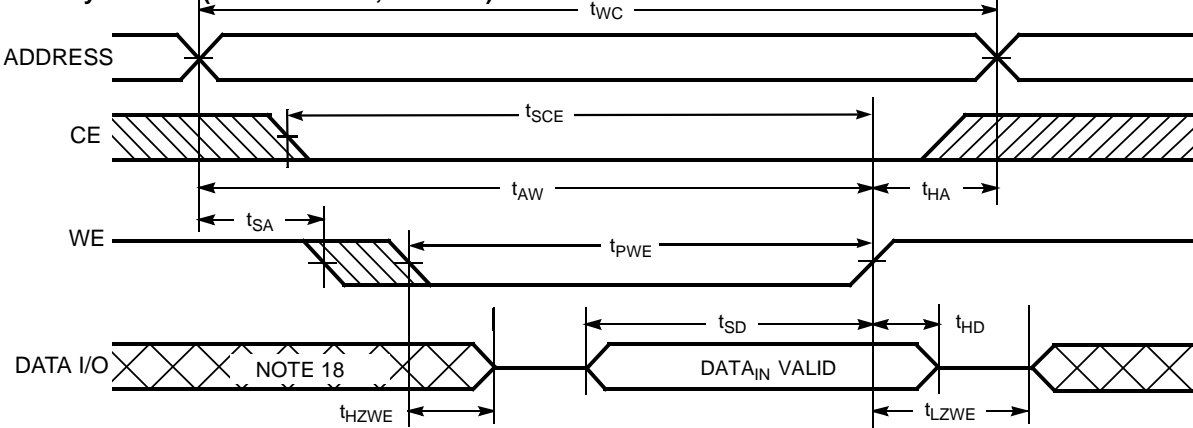

Write Cycle No. 1 (\overline{WE} Controlled) [17, 19]

Notes:

- 16. Address valid prior to or coincident with \overline{CE} transition LOW.
- 17. Data I/O is high impedance if $OE = V_{IH}$.
- 18. During this period, the I/Os are in output state and input signals should not be applied.
- 19. If CE goes HIGH simultaneously with WE HIGH, the output remains in high-impedance state.
