#### **Legal Disclaimer**

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

#### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

#### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## Table of Contents

	<b>Table of Contents</b>	1-1
<b>1</b>	<b>Summary of Features</b>	1-1
<b>2</b>	<b>System Overview of the TC1782</b>	2-12
2.1	Block Diagrams	2-13
<b>3</b>	<b>Pinning</b>	3-16
3.1	TC1782 Pin Configuration	3-17
<b>4</b>	<b>Identification Registers</b>	4-42
<b>5</b>	<b>Electrical Parameters</b>	5-45
5.1	General Parameters	5-45
5.1.1	Parameter Interpretation	5-45
5.1.2	Pad Driver and Pad Classes Summary	5-46
5.1.3	Absolute Maximum Ratings	5-47
5.1.4	Pin Reliability in Overload	5-48
5.1.5	Operating Conditions	5-50
5.2	DC Parameters	5-59
5.2.1	Input/Output Pins	5-59
5.2.2	Analog to Digital Converters (ADCx)	5-74
5.2.3	Fast Analog to Digital Converter (FADC)	5-80
5.2.4	Oscillator Pins	5-85
5.2.5	Temperature Sensor	5-86
5.2.6	Power Supply Current	5-87
5.2.6.1	Calculating the 1.3 V Current Consumption	5-91
5.3	AC Parameters	5-92
5.3.1	Testing Waveforms	5-92
5.3.2	Power Sequencing	5-93
5.3.3	Power, Pad and Reset Timing	5-96
5.3.4	Phase Locked Loop (PLL)	5-99
5.3.5	ERAY Phase Locked Loop (ERAY_PLL)	5-101
5.3.6	JTAG Interface Timing	5-102
5.3.7	DAP Interface Timing	5-104
5.3.8	Peripheral Timings	5-106
5.3.8.1	Micro Link Interface (MLI) Timing	5-106
5.3.8.2	Micro Second Channel (MSC) Interface Timing	5-108
5.3.8.3	SSC Master/Slave Mode Timing	5-110
5.3.8.4	ERAY Interface Timing	5-112
5.4	Package and Reliability	5-114
5.4.1	Package Parameters	5-114
5.4.2	Package Outline	5-115

5.4.3	Flash Memory Parameters .....	5-115
5.4.4	Quality Declarations .....	5-117
<b>6</b>	<b>History .....</b>	<b>6-119</b>

## Summary of Features

### 1 Summary of Features

The **SAK-TC1782F-320F180HR / SAK-TC1782F-320F180HL** has the following features:

- High-performance 32-bit super-scalar TriCore V1.3.1 CPU with 4-stage pipeline
  - Superior real-time performance
  - Strong bit handling
  - Fully integrated DSP capabilities
  - Single precision Floating Point Unit (FPU)
  - 180 MHz operation at full temperature range
- 32-bit Peripheral Control Processor with single cycle instruction (PCP2)
  - 16 Kbyte Parameter Memory (PRAM)
  - 32 Kbyte Code Memory (CMEM)
  - 180 MHz operation at full temperature range
- Multiple on-chip memories
  - 2.5 Mbyte Program Flash Memory (PFLASH) with ECC
  - 128 Kbyte Data Flash Memory (DFLASH) usable for EEPROM emulation
  - 128 Kbyte Data Memory (LDRAM)
  - Instruction Cache: up to 16 Kbyte (ICACHE, configurable)
  - 40 Kbyte Code Scratchpad Memory (SPRAM)
  - Data Cache: up to 4 Kbyte (DCACHE, configurable)
  - 8 Kbyte Overlay Memory (OVRAM)
  - 16 Kbyte BootROM (BROM)
- 16-Channel DMA Controller
- Sophisticated interrupt system with  $2 \times 255$  hardware priority arbitration levels serviced by CPU or PCP2
- High performing on-chip bus structure
  - 64-bit Local Memory Buses between CPU, Flash and Data Memory
  - 32-bit System Peripheral Bus (SPB) for on-chip peripheral and functional units
  - One bus bridge (LFI Bridge)
- Versatile On-chip Peripheral Units
  - Two Asynchronous/Synchronous Serial Channels (ASC) with baud rate generator, parity, framing and overrun error detection
  - Three High-Speed Synchronous Serial Channels (SSC) with programmable data length and shift direction
  - One serial Micro Second Bus interface (MSC) for serial port expansion to external power devices
  - One High-Speed Micro Link interface (MLI) for serial inter-processor communication
  - One MultiCAN Module with 3 CAN nodes and 128 free assignable message objects for high efficiency data handling via FIFO buffering and gateway data transfer (one CAN node supports TTCAN functionality)
  - One FlexRay™ module with 2 channels (E-Ray).

---

## Summary of Features

- One General Purpose Timer Array Module (GPTA) with additional Local Timer Cell Array (LTCA2) providing a powerful set of digital signal filtering and timer functionality to realize autonomous and complex Input/Output management
- 32 analog input lines for ADC
  - 2 independent kernels (ADC0 and ADC1)
  - Analog supply voltage range from 3.3 V to 5 V (single supply)
- 4 different FADC input channels
  - channels with impedance control and overlaid with ADC1 inputs
  - Extreme fast conversion, 21 cycles of  $f_{\text{FADC}}$  clock
  - 10-bit A/D conversion (higher resolution can be achieved by averaging of consecutive conversions in digital data reduction filter)
- 86 digital general purpose I/O lines (GPIO), 4 input lines
- Digital I/O ports with 3.3 V capability
- On-chip debug support for OCDS Level 1 (CPU, PCP, DMA, On Chip Bus)
- Dedicated Emulation Device chip available (TC1782ED)
  - multi-core debugging, real time tracing, and calibration
  - four/five wire JTAG (IEEE 1149.1) or two wire DAP (Device Access Port) interface
- Power Management System
- Clock Generation Unit with PLL

---

## Summary of Features

The **SAK-TC1782N-320F180HR / SAK-TC1782N-320F180HL** has the following features:

- High-performance 32-bit super-scalar TriCore V1.3.1 CPU with 4-stage pipeline
  - Superior real-time performance
  - Strong bit handling
  - Fully integrated DSP capabilities
  - Single precision Floating Point Unit (FPU)
  - 180 MHz operation at full temperature range
- 32-bit Peripheral Control Processor with single cycle instruction (PCP2)
  - 16 Kbyte Parameter Memory (PRAM)
  - 32 Kbyte Code Memory (CMEM)
  - 180 MHz operation at full temperature range
- Multiple on-chip memories
  - 2.5 Mbyte Program Flash Memory (PFLASH) with ECC
  - 128 Kbyte Data Flash Memory (DFLASH) usable for EEPROM emulation
  - 128 Kbyte Data Memory (LDRAM)
  - Instruction Cache: up to 16 Kbyte (ICACHE, configurable)
  - 40 Kbyte Code Scratchpad Memory (SPRAM)
  - Data Cache: up to 4 Kbyte (DCACHE, configurable)
  - 8 Kbyte Overlay Memory (OVRAM)
  - 16 Kbyte BootROM (BROM)
- 16-Channel DMA Controller
- Sophisticated interrupt system with  $2 \times 255$  hardware priority arbitration levels serviced by CPU or PCP2
- High performing on-chip bus structure
  - 64-bit Local Memory Buses between CPU, Flash and Data Memory
  - 32-bit System Peripheral Bus (SPB) for on-chip peripheral and functional units
  - One bus bridge (LFI Bridge)
- Versatile On-chip Peripheral Units
  - Two Asynchronous/Synchronous Serial Channels (ASC) with baud rate generator, parity, framing and overrun error detection
  - Three High-Speed Synchronous Serial Channels (SSC) with programmable data length and shift direction
  - One serial Micro Second Bus interface (MSC) for serial port expansion to external power devices
  - One High-Speed Micro Link interface (MLI) for serial inter-processor communication
  - One MultiCAN Module with 3 CAN nodes and 128 free assignable message objects for high efficiency data handling via FIFO buffering and gateway data transfer (one CAN node supports TTCAN functionality)

**Summary of Features****Ordering Information**

The ordering code for Infineon microcontrollers provides an exact reference to the required product. This ordering code identifies:

- The derivative itself, i.e. its function set, the temperature range, and the supply voltage
- The package and the type of delivery.

For the available ordering codes for the TC1782 please refer to the “**Product Catalog Microcontrollers**”, which summarizes all available microcontroller variants.

This document describes the derivatives of the device. The **Table 1** enumerates these derivatives and summarizes the differences.

**Table 1 TC1782 Derivative Synopsis**

Derivative	Ambient Temperature Range	Package
SAK-TC1782F-320F180HR	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-20
SAK-TC1782F-320F180HL	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-10
SAK-TC1782N-320F180HR	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-20
SAK-TC1782N-320F180HL	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-10
SAK-TC1782N-256F133HR	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-20
SAK-TC1782N-256F133HL	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-10
SAK-TC1782F-320F160HR	$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$	PG-LQFP-176-20

## System Overview of the TC1782

### 2 System Overview of the TC1782

The TC1782 combines three powerful technologies within one silicon die, achieving new levels of power, speed, and economy for embedded applications:

- Reduced Instruction Set Computing (RISC) processor architecture
- Digital Signal Processing (DSP) operations and addressing modes
- On-chip memories and peripherals

DSP operations and addressing modes provide the computational power necessary to efficiently analyze complex real-world signals. The RISC load/store architecture provides high computational bandwidth with low system cost. On-chip memory and peripherals are designed to support even the most demanding high-bandwidth real-time embedded control-systems tasks.

Additional high-level features of the TC1782 include:

- Efficient memory organization: instruction and data scratch memories, caches
- Serial communication interfaces – flexible synchronous and asynchronous modes
- Peripheral Control Processor – standalone data operations and interrupt servicing
- DMA Controller – DMA operations and interrupt servicing
- General-purpose timers
- High-performance on-chip buses
- On-chip debugging and emulation facilities
- Flexible interconnections to external components
- Flexible power-management

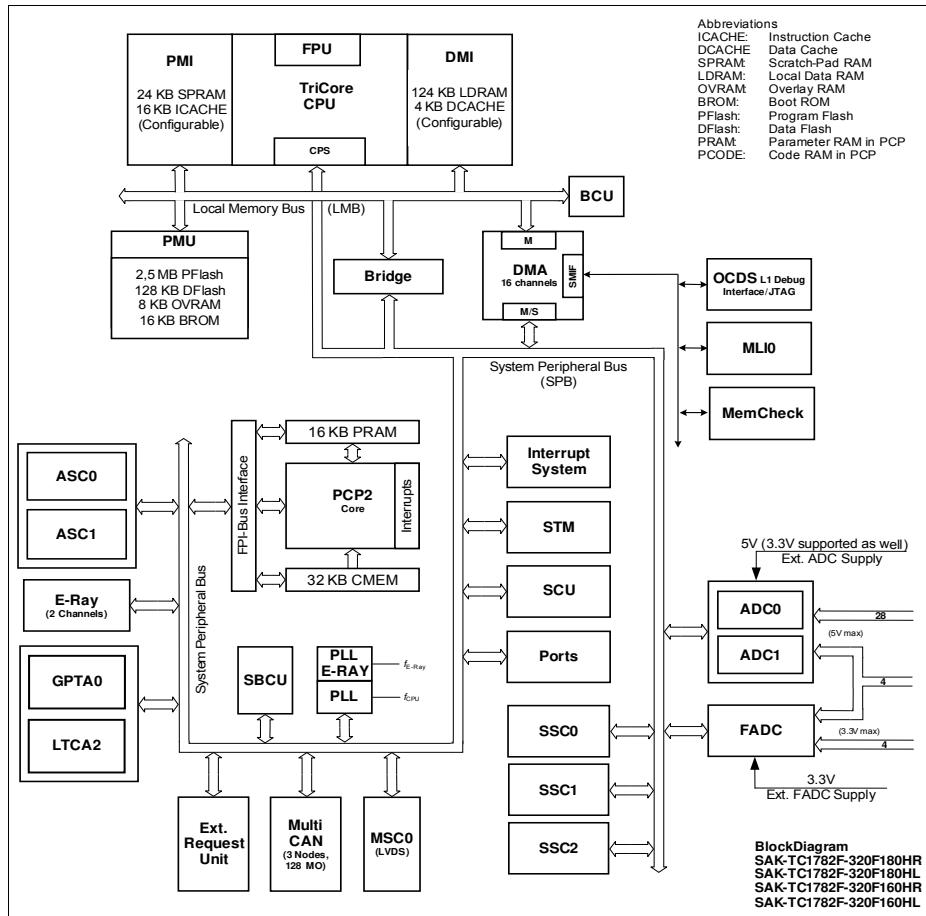

The TC1782 is a high-performance microcontroller with TriCore CPU, program and data memories, buses, bus arbitration, an interrupt controller, a peripheral control processor and a DMA controller and several on-chip peripherals. The TC1782 is designed to meet the needs of the most demanding embedded control systems applications where the competing issues of price/performance, real-time responsiveness, computational power, data bandwidth, and power consumption are key design elements.

The TC1782 offers several versatile on-chip peripheral units such as serial controllers, timer units, and Analog-to-Digital converters. Within the TC1782, all these peripheral units are connected to the TriCore CPU/system via the Flexible Peripheral Interconnect (FPI) Bus and the Local Memory Bus (LMB). Several I/O lines on the TC1782 ports are reserved for these peripheral units to communicate with the external world.

## System Overview of the TC1782 Block Diagrams

### 2.1 Block Diagrams

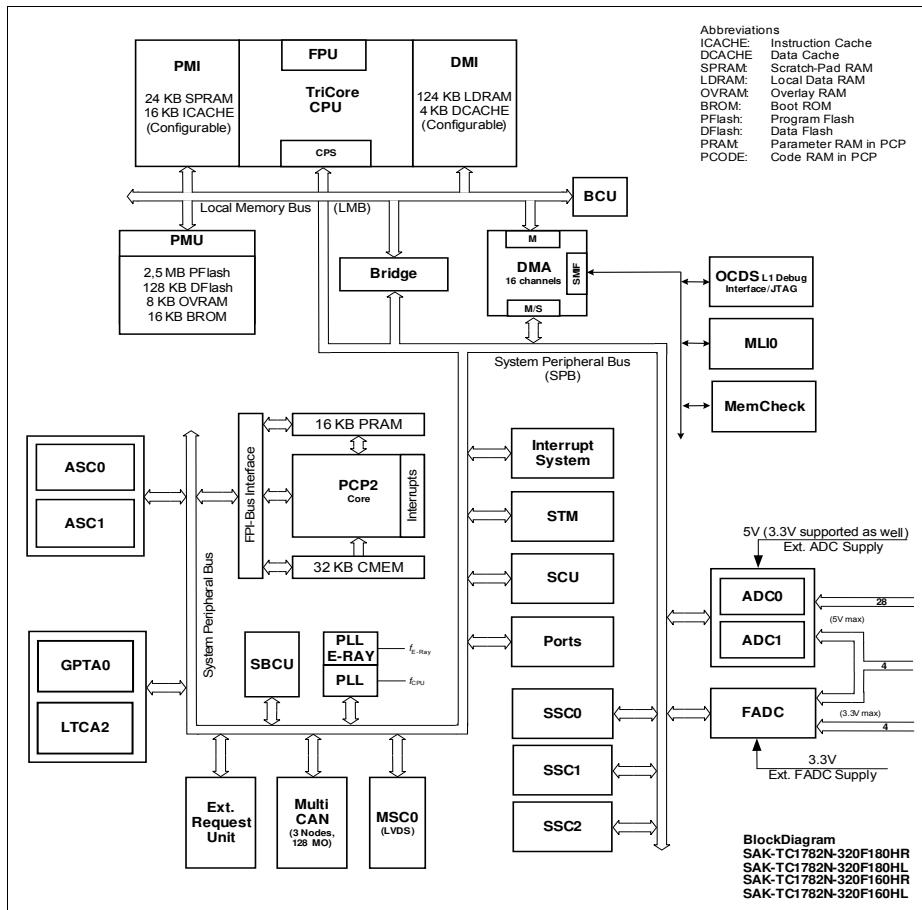

**Figure 1** shows the block diagram of the **SAK-TC1782-320F180HR / SAK-TC1782-320F180HL / SAK-TC1782-320F160HR / SAK-TC1782-320F160HL**.

1) Only available for SAK-TC1782F-320F180HR, SAK-TC1782F-320F180HL, and SAK-TC1782F-320F160HR.

2) For the emulation device (ED), this pin is bonded to VDDSB (ED Stand By RAM supply). In the production device, this pin is bonded to a VDD pad.

### Legend for Table 2

Column “Ctrl.”:

I = Input (for GPIO port lines with IOCR bit field selection PCx = 0XXX<sub>B</sub>)

O = Output

O0 = Output with IOCR bit field selection PCx = 1X00<sub>B</sub>

O1 = Output with IOCR bit field selection PCx = 1X01<sub>B</sub> (ALT1)

O2 = Output with IOCR bit field selection PCx = 1X10<sub>B</sub> (ALT2)

O3 = Output with IOCR bit field selection PCx = 1X11 (ALT3)

Column “Type”:

A1 = Pad class A1 (LVTTL)

A1+ = Pad class A1+ (LVTTL)

A2 = Pad class A2 (LVTTL)

---

## Pinning TC1782 Pin Configuration

F = Pad class F (LVDS/CMOS)

D = Pad class D (ADC)

I = Pad class I (LVTTL)

PU = with pull-up device connected during reset ( $\overline{\text{PORST}} = 0$ )

PD = with pull-down device connected during reset ( $\overline{\text{PORST}} = 0$ )

TR = tri-state during reset ( $\overline{\text{PORST}} = 0$ )

---

**Identification Registers**

## 4 Identification Registers

The Identification Registers uniquely identify the whole device.

**Electrical ParametersGeneral Parameters**

## 5 Electrical Parameters

This specification provides all electrical parameters of the TC1782.

### 5.1 General Parameters

#### 5.1.1 Parameter Interpretation

The parameters listed in this section partly represent the characteristics of the TC1782 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are marked with an two-letter abbreviation in column "Symbol":

- **CC**  
Such parameters indicate **Controller Characteristics** which are a distinctive feature of the TC1782 and must be regarded for a system design.
- **SR**  
Such parameters indicate **System Requirements** which must provided by the microcontroller system in which the TC1782 designed in.

---

## Electrical ParametersGeneral Parameters

### 5.1.2 Pad Driver and Pad Classes Summary

This section gives an overview on the different pad driver classes and its basic characteristics. More details (mainly DC parameters) are defined in the [Section 5.2.1](#).

**Table 13 Pad Driver and Pad Classes Overview**

Class	Power Supply	Type	Sub Class	Speed Grade 1)	Load 1)	Leakage 150°C 1)	Termination
<b>A</b>	3.3 V	LVTTL I/O, LVTTL outputs	<b>A1</b> (e.g. GPIO)	6 MHz	100 pF	500 nA	No
			<b>A1+</b> (e.g. serial I/Os)	25 MHz	50 pF	1 µA	Series termination recommended
			<b>A2</b> (e.g. serial I/Os)	40 MHz	50 pF	3 µA	Series termination recommended
<b>F</b>	3.3 V	LVDS	–	50 MHz	–	–	Parallel termination, $100 \Omega \pm 10\%$ 2)
			CMOS	–	6 MHz	50 pF	–
<b>D<sub>E</sub></b>	5 V	ADC	–	–	–	–	–
<b>I</b>	3.3 V	LVTTL (input only)	–	–	–	–	–

- 1) These values show typical application configurations for the pad. Complete and detailed pad parameters are available in the individual pad parameter table on the following pages.
- 2) In applications where the LVDS pins are not used (disabled), these pins must be either left unconnected, or properly terminated with the differential parallel termination of  $100 \Omega \pm 10\%$ .

---

**Electrical ParametersGeneral Parameters**

### 5.1.3 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Table 14 Absolute Maximum Rating Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Storage temperature	$T_{ST}$ SR	-65	–	150	°C	
Voltage at 1.3 V power supply pins with respect to $V_{SS}$	$V_{DD}$ SR	–	–	2.0	V	
Voltage at 3.3 V power supply pins with respect to $V_{SS}$	$V_{DDP}$ SR	–	–	4.33	V	
Voltage at 5 V power supply pins with respect to $V_{SS}$	$V_{DDM}$ SR	–	–	7.0	V	
Voltage on any Class A input pin and dedicated input pins with respect to $V_{SS}$	$V_{IN}$ SR	-0.6	–	$V_{DDP} + 0.7$ or max. 4.33	V	Whatever is lower
Voltage on any Class D analog input pin with respect to $V_{AGND0}$	$V_{AIN}$ $V_{AREFO}$ SR	-0.6	–	7.0	V	
Voltage on any shared Class D analog input pin with respect to $V_{SSAF}$ , if the FADC is switched through to the pin.	$V_{AINF}$ SR	-0.6	–	7.0	V	
Input current on any pin during overload condition	$I_{IN}$	-10	–	+10	mA	
Absolute maximum sum of all input circuit currents for one port group during overload condition <sup>1)</sup>	$I_{IN}$	-25	–	+25	mA	
Absolute maximum sum of all input circuit currents during overload condition	$\Sigma I_{IN}$	–	–	200	mA	

1) The port groups are defined in [Table 19](#).

---

## Electrical ParametersGeneral Parameters

### 5.1.4 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

**Table 15** defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time (24000 h) is not exceeded
- **Operating Conditions** are met for
  - pad supply levels ( $V_{DDP}$  or  $V_{DDM}$ )
  - temperature

If a pin current is out of the **Operating Conditions** but within the overload parameters, then the parameters functionality of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

*Note: An overload condition on one or more pins does not require a reset.*

**Table 15 Overload Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input current on any digital pin during overload condition except LVDS pins	$I_{IN}$	-5	-	+5	mA	
Input current on LVDS pins	$I_{INLVDS}$	-3	-	+3	mA	
Absolute sum of all input circuit currents for one port group during overload condition <sup>1)</sup>	$I_{ING}$	-20	-	+20	mA	
Input current on analog pins	$I_{INANA}$	-3	-	+3	mA	
Absolute sum of all analog input currents for analog inputs of a single ADC during overload condition	$I_{INSAS}$	-15	-	+15	mA	
Absolute sum of all input circuit currents during overload condition	$\Sigma I_{INS}$	-100	-	100	mA	

1) The port groups are defined in [Table 19](#).

*Note: FADC input pins count as analog pin as they are overlayed with an ADC pins.*

---

**Electrical ParametersGeneral Parameters**
**Table 16 PN-Junction Characterisitics for positive Overload**

<b>Pad Type</b>	$I_{IN} = 3 \text{ mA}$	$I_{IN} = 5 \text{ mA}$
A1 / A1+ / F	$U_{IN} = V_{DDP} + 0.6 \text{ V}$	$U_{IN} = V_{DDP} + 0.7 \text{ V}$
A2	$U_{IN} = V_{DDP} + 0.5 \text{ V}$	$U_{IN} = V_{DDP} + 0.6 \text{ V}$
LVDS	$U_{IN} = V_{DDP} + 0.7 \text{ V}$	-
D	$U_{IN} = V_{DDM} + 0.6 \text{ V}$	-

**Table 17 PN-Junction Characterisitics for negative Overload**

<b>Pad Type</b>	$I_{IN} = -3 \text{ mA}$	$I_{IN} = -5 \text{ mA}$
A1 / A1+ / F	$U_{IN} = V_{SS} - 0.6 \text{ V}$	$U_{IN} = V_{SS} - 0.7 \text{ V}$
A2	$U_{IN} = V_{SS} - 0.5 \text{ V}$	$U_{IN} = V_{SS} - 0.6 \text{ V}$
LVDS	$U_{IN} = V_{SS} - 0.7 \text{ V}$	-
D	$U_{IN} = V_{SSM} - 0.6 \text{ V}$	-

*Note: A series resistor at the pin to limit the current to the maximum permitted overload current is sufficient to handle failure situations like short to battery without having any negative reliability impact on the operational life-time.*

---

**Electrical ParametersGeneral Parameters**

### 5.1.5 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the TC1782.

Digital supply voltages applied to the TC1782 must be static regulated voltages which allow a typical voltage swing of  $\pm 5\%$ .

All parameters specified in the following tables refer to these operating conditions (**Table 18**), unless otherwise noticed in the Note / Test Condition column.

The **Voltage Operating Timing Profiles** did not increase area of validity of the parameters defined in table 8 and later.

**Table 18 Operating Conditions Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Overload coupling factor for analog inputs, negative	$K_{OVAN}$ CC	–	–	0.000 1		$I_{OV} \leq 0\text{ mA}; I_{OV} \geq -2\text{ mA}; \text{analog pad}=5.0\text{ V}$
Overload coupling factor for analog inputs, positive	$K_{OVAP}$ CC	–	–	0.000 01		$I_{OV} \leq 3\text{ mA}; I_{OV} \geq 0\text{ mA}; \text{analog pad}=5.0\text{ V}$

## Electrical ParametersGeneral Parameters

**Table 18 Operating Conditions Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
FADC / ADC analog supply voltage	$V_{DDMF}$ SR	2.97	3.3	3.63 <sup>4)</sup>	V	for duration limitation see <b>Voltage Operating Timing Profiles</b>
Analog ground voltage for $V_{DDMF}$	$V_{SSAF}$ SR	-0.1	0	0.1	V	

- 1) Applicable for digital outputs.
- 2) Voltage overshoot to 1.7V is permissible at Power-Up and PORST low, provided the pulse duration is less than 100  $\mu$ s and the cumulated sum of the pulses does not exceed 1 h.
- 3) Voltage overshoot to 6.5V is permissible at Power-Up and PORST low, provided the pulse duration is less than 100  $\mu$ s and the cumulated sum of the pulses does not exceed 1 h.
- 4) Voltage overshoot to 4.0V is permissible at Power-Up and PORST low, provided the pulse duration is less than 100  $\mu$ s and the cumulated sum of the pulses does not exceed 1 h.
- 5) This parameter is valid under the assumption the PORST signal is constantly at low level during the power-up/power-down of  $V_{DDP}$ .

### Voltage Operating Timing Profiles

- $1.3V < V_{DD} / V_{DDOSC} / V_{DDAF} < 1.3V + 5\%:$ 
  - limited to Operation Lifetime ( $t_{OP}$ ) (see **Table 46**)
- $1.3V + 5\% < V_{DD} / V_{DDOSC} / V_{DDAF} < 1.3V + 7.5\%$  (overvoltage condition):
  - limited to 10000 hour duration cumulative in lifetime, due to the reliability reduction of the chip caused by the overvoltage stress.
- $1.3V + 7.5\% < V_{DD} / V_{DDOSC} / V_{DDAF} < 1.3V + 10\%$  (overvoltage condition):
  - limited to 1000 hour duration cumulative in lifetime, due to the reliability reduction of the chip caused by the overvoltage stress.
- $3.3V < V_{DDP} / V_{DDOSC3} / V_{DDFL3} / V_{DDMF} < 3.3V + 5\%:$ 
  - limited to Operation Lifetime ( $t_{OP}$ ) (see **Table 46**)
- $V_{DDP} / V_{DDOSC3} / V_{DDFL3} / V_{DDMF} < 3.3V + 10\%:$ 
  - $3.3V + 5\% < V_{DDP} / V_{DDOSC3} / V_{DDFL3} / V_{DDMF} < 3.3V + 10\%$  (overvoltage condition):
    - limited to 1000 hour duration cumulative in lifetime, due to the reliability reduction of the chip caused by the overvoltage stress.
- $5V < V_{DDM} < 5V + 10\%:$ 
  - limited to Operation Lifetime ( $t_{OP}$ ) (see **Table 46**)

## Electrical ParametersDC Parameters

**Table 27 ADC Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Resistance of the reference voltage input path	$R_{\text{AREF CC}}$	—	500	1000	Ohm	
Sample time	$t_S \text{ CC}$	2	—	257	$T_{\text{ADCI}}$	
Calibration time after bit ADC_GLOBCFG.SUCAL is set	$t_{\text{CAL CC}}$	—	—	4352	cycle s	
Total Unadjusted Error <sup>6)5)12)</sup>	$TUE \text{ CC}$	-4	—	$4^{13)}$	LSB	ADC resolution= 12-bit
Analog reference ground <sup>2)</sup>	$V_{\text{AGNDO SR}}$	$V_{\text{SSM}} - 0.05$	—	$V_{\text{AREFO}} - 1$	V	
Analog input voltage	$V_{\text{AIN SR}}$	$V_{\text{AGNDO}}$	—	$V_{\text{AREFO}}$	V	
Analog reference voltage <sup>2)</sup>	$V_{\text{AREFO SR}}$	$V_{\text{AGNDO}} + 1$	—	$V_{\text{DDM}} + 0.05^{14)}_{15)}$	V	
Analog reference voltage range <sup>6)5)2)</sup>	$V_{\text{AREFO}} - V_{\text{AGNDO SR}}$	$V_{\text{DDM}}/2$	—	$V_{\text{DDM}} + 0.05$	V	

1) The sampling capacity of the conversion C-network is pre-charged to  $V_{\text{AREFO}}/2$  before the sampling moment. Because of the parasitic elements the voltage measured at AINx can deviate from  $V_{\text{AREFO}}/2$ .

2) Applies to AINx, when used as auxiliary reference input.

3) This represents an equivalent switched capacitance. This capacitance is not switched to the reference voltage at once. Instead smaller capacitances are successively switched to the reference voltage.

4) The sum of DNL/INL/GAIN/OFF errors does not exceed the related TUE total unadjusted error.

5) If a reduced analog reference voltage between 1V and  $V_{\text{DDM}}/2$  is used, then there are additional decrease in the ADC speed and accuracy.

6) If the analog reference voltage range is below  $V_{\text{DDM}}$  but still in the defined range of  $V_{\text{DDM}}/2$  and  $V_{\text{DDM}}$  is used, then the ADC converter errors increase. If the reference voltage is reduced by the factor k ( $k < 1$ ), TUE,DNL,INL,Gain, and Offset errors increase also by the factor  $1/k$ .

7) If the analog reference voltage is  $> V_{\text{DDM}}$ , then the ADC converter errors increase.

8) For 10-bit conversions the error value must be multiplied with a factor 0.25.

9) For 8-bit conversions the error value must be multiplied with a factor 0.0625.

10) For a conversion time of 1  $\mu\text{s}$  a rms value of 85  $\mu\text{A}$  result for  $I_{\text{AREFO}}$ .

11) The leakage current definition is a continuous function, as shown in figure ADCx Analog Input Leakage. The numerical values defined determine the characteristic points of the given continuous linear approximation - they do not define step function.

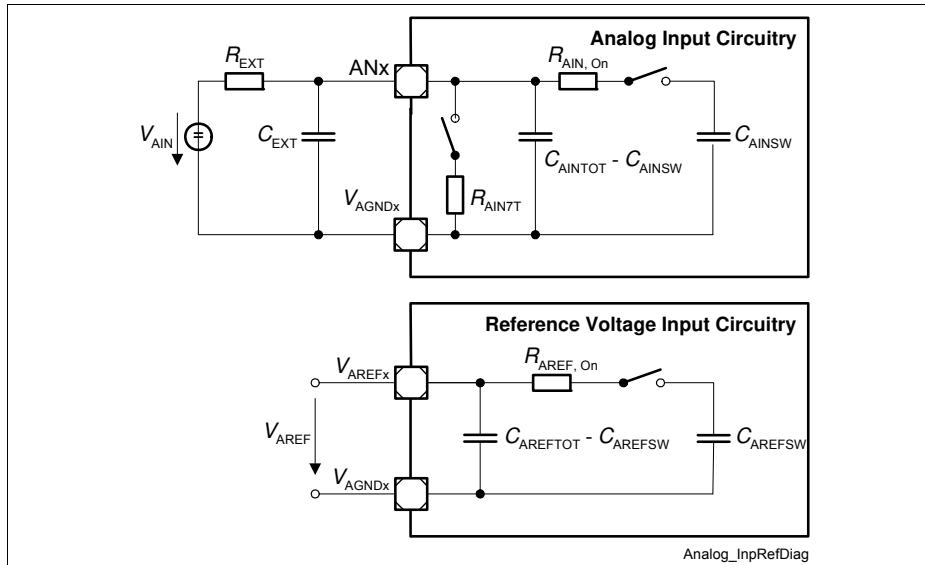

## Electrical ParametersDC Parameters

- 12) Measured without noise.
- 13) For 10-bit conversion the TUE is  $\pm 2\text{LSB}$ ; for 8-bit conversion the TUE is  $\pm 1\text{LSB}$
- 14) A running conversion may become inexact in case of violating the normal conditions (voltage overshoot).
- 15) If the reference voltage  $V_{\text{AREFO}}$  increase or the  $V_{\text{DDM}}$  decrease, so that  $V_{\text{AREF}} = (V_{\text{DDM}} + 0.05\text{V} \text{ to } V_{\text{DDM}} - 0.07\text{V})$ , then the accuracy of the ADC decrease by 4LSB12.

**Table 28 Conversion Time (Operating Conditions apply)**

Parameter	Symbol	Values	Unit	Note
Conversion time with post-calibration	$t_C$ CC	$2 \times T_{\text{ADC}} + (4 + \text{STC} + n) \times T_{\text{ADCI}}$	$\mu\text{s}$	$n = 8, 10, 12$ for $n$ - bit conversion $T_{\text{ADC}} = 1 / f_{\text{FPI}}$ $T_{\text{ADCI}} = 1 / f_{\text{ADCI}}$
Conversion time without post-calibration		$2 \times T_{\text{ADC}} + (2 + \text{STC} + n) \times T_{\text{ADCI}}$		

The power-up calibration of the ADC requires a maximum number of  $4352 f_{\text{ADCI}}$  cycles.

## Electrical ParametersDC Parameters

- 1) This value applies in power-down mode.
- 2) No missing codes.
- 3) Calibration should be performed at each power-up. In case of a continuous operation, it should be performed minimum once per week.
- 4) The offset error voltage drifts over the whole temperature range maximum  $\pm 3\text{LSB}$ .
- 5) Voltage overshoot to 4V is permissible, provided the pulse duration is less than  $100\ \mu\text{s}$  and the cumulated sum of the pulses does not exceed 1 h.
- 6) A running conversion may become inexact in case of violating the nominal operating conditions (voltage overshoots).

The calibration procedure should run after each power-up, when all power supply voltages and the reference voltage have stabilized.

**Figure 9 FADC Input Circuits**

---

**Electrical ParametersDC Parameters**
**5.2.4 Oscillator Pins**
**Table 30 OSC\_XTAL Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input current at XTAL1	$I_{IX1}$ CC	-25	–	25	$\mu\text{A}$	$V_{IN} < V_{DDOSC3}$ ; $V_{IN} > 0 \text{ V}$
Input frequency	$f_{osc}$ SR	4	–	40	MHz	Direct Input Mode selected
		8	–	25	MHz	External Crystal Mode selected
Oscillator start-up time <sup>1)</sup>	$t_{oscS}$ CC	–	–	10	ms	
Input high voltage at XTAL1 <sup>2)</sup>	$V_{IHX}$ SR	$0.7 \times V_{DDOS}$ C3	–	$V_{DDOS}$ C3 + 0.5	V	
Input low voltage at XTAL1	$V_{ILX}$ SR	-0.5	–	$0.3 \times V_{DDOS}$ C3	V	
Input Hysteresis for XTAL1 pad <sup>3)</sup>	HYSAX CC	–	–	200	mV	

1)  $t_{oscS}$  is defined from the moment when  $V_{DDOSC3} = 3.13\text{V}$  until the oscillations reach an amplitude at XTAL1 of  $0.3 * V_{DDOSC3}$ . The external oscillator circuitry must be optimized by the customer and checked for negative resistance as recommended and specified by crystal suppliers.

- 2) If the XTAL1 pin is driven by a crystal, reaching a minimum amplitude (peak-to-peak) of  $0.4 * V_{DDOSC3}$  is necessary.
- 3) Hysteresis is implemented to avoid metastable states and switching due to internal ground bounce. It can't be guaranteed that it suppresses switching due to external system noise.

*Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal or ceramic resonator supplier.*

### 5.2.5 Temperature Sensor

Table 31 DTS Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Measurement time	$t_M$ CC	–	–	100	μs	
Temperature sensor range	$T_{SR}$ SR	-40	–	150	°C	
Sensor Accuracy (calibrated)	$T_{TSA}$ CC	-6	–	6	°C	
Start-up time after resets inactive	$t_{TSST}$ SR	–	–	20	μs	

The following formula calculates the temperature measured by the DTS in [°C] from the RESULT bit field of the DTSSTAT register.

(1)

$$T_J = \frac{DTSSTATRESULT - 596}{2,03}$$

---

**Electrical ParametersDC Parameters**

### 5.2.6 Power Supply Current

The total power supply current defined below consists of leakage and switching component.

Application relevant values are typically lower than those given in the following two tables and depend on the customer's system operating conditions (e.g. thermal connection or used application configurations).

The operating conditions for the parameters in the following table are:

$V_{DD}=1.365\text{ V}$ ,  $V_{DDP}=3.47\text{ V}$ ,  $V_{DDM}=5.1\text{ V}$ ,  $f_{LMB}=180 / 160\text{ MHz} / 133\text{ MHz}$ ,  $T_J=150\text{ }^{\circ}\text{C}$

The realistic power pattern defines the following conditions:

- $T_J=150\text{ }^{\circ}\text{C}$
- $f_{LMB}=f_{PCP}=f_{CPU}=180 / 160\text{ MHz} / 133\text{ MHz}$
- $f_{FPI}=90\text{ MHz} / 80\text{ MHz} / 66.5\text{ MHz}$
- $V_{DD}=V_{DDOSC}=V_{DDAF}=1.326\text{ V}$
- $V_{DDP}=V_{DDOSC3}=V_{DDFL3}=V_{DDMF}=3.366\text{ V}$
- $V_{DDM}=5.1\text{ V}$

The max power pattern defines the following conditions:

- $T_J=150\text{ }^{\circ}\text{C}$
- $f_{LMB}=f_{PCP}=f_{CPU}=180 / 160\text{ MHz} / 133\text{ MHz}$
- $f_{FPI}=90\text{ MHz} / 80\text{ MHz} / 66.5\text{ MHz}$
- $V_{DD}=V_{DDOSC}=V_{DDAF}=1.365\text{ V} / 1.43\text{ V} / 1.365\text{ V}$
- $V_{DDP}=V_{DDOSC3}=V_{DDFL3}=V_{DDMF}=3.47\text{ V} / 3.63\text{ V} / 3.47\text{ V}$
- $V_{DDM}=5.5\text{ V}$

- 1) Infineon Power Loop: CPU and PCP running, all peripherals active. The power consumption of each customer application will most probably be lower than this value, but must be evaluated separately.
- 2) This current includes the E-Ray module power consumption, including the PCP operation component.
- 3) The  $I_{DD}$  decreases typically by 68mA if the  $f_{CPU}$  decreases by 50MHz, at constant  $T_j$
- 4) The  $I_{DD}$  decreases typically by 30mA if the  $f_{CPU}$  decreases by 50MHz, at constant  $T_j$
- 5) For operations including the D-Flash the required currents are always lower than the currents for non D-Flash operation.
- 6) Relevant for the power supply dimensioning, not for thermal considerations.

---

**Electrical ParametersDC Parameters**

- 7) In case of erase of Program Flash PF, internal flash array loading effects may generate transient current spikes of up to 15 mA for maximum 5 ms per flash module.

### 5.2.6.1 Calculating the 1.3 V Current Consumption

The current consumption of the 1.3 V rail compose out of two parts:

- Static current consumption
- Dynamic current consumption

The static current consumption is related to the device temperature  $T_J$  and the dynamic current consumption depends of the configured clocking frequencies and the software application executed. These two parts needs to be added in order to get the rail current consumption.

(2)

$$I_0 = 2,20897 \left[ \frac{\text{mA}}{\text{C}} \right] \times e^{0,02696 \times T_J[\text{C}]}$$

(3)

$$I_0 = 10,68 \left[ \frac{\text{mA}}{\text{C}} \right] \times e^{0,02203 \times T_J[\text{C}]}$$

Function 2 defines the typical static current consumption and Function 3 defines the maximum static current consumption. Both functions are valid for  $V_{DD} = 1.326$  V.

For the dynamic current consumption using the application pattern and  $f_{LMB} = 2 * f_{FPI}$  the function 4 applies:

(4)

$$I_{Dym} = 0,6 \left[ \frac{\text{mA}}{\text{MHz}} \right] \times f_{CPU}[\text{MHz}]$$

and this finally results in

(5)

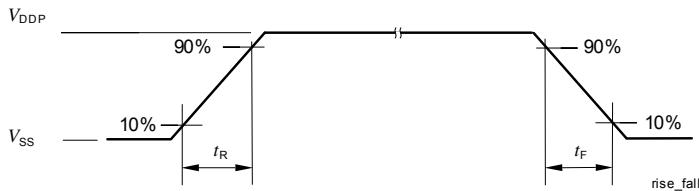

$$I_{DD} = I_0 + I_{DYM}$$

## Electrical Parameters

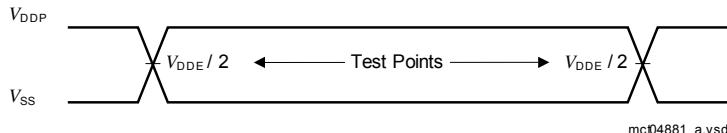

### 5.3 AC Parameters

All AC parameters are defined with maximum driver strength unless otherwise noted.

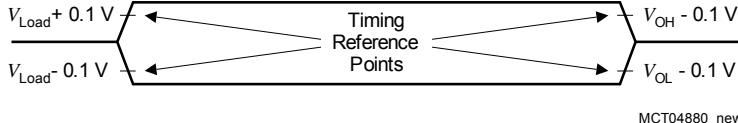

#### 5.3.1 Testing Waveforms

**Figure 10** Rise/Fall Time Parameters

**Figure 11** Testing Waveform, Output Delay

**Figure 12** Testing Waveform, Output High Impedance

## Electrical Parameters AC Parameters

## 5.3.2 Power Sequencing

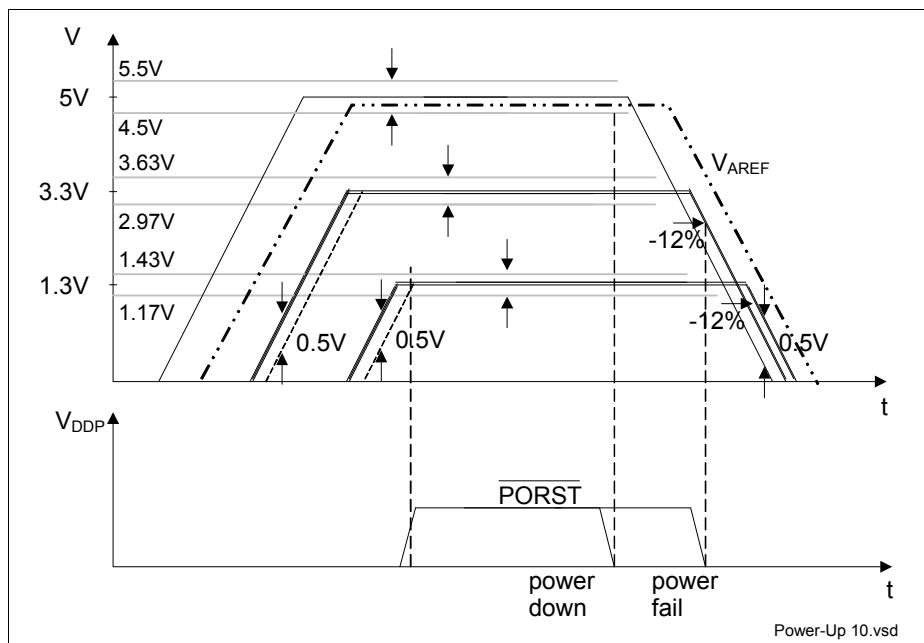

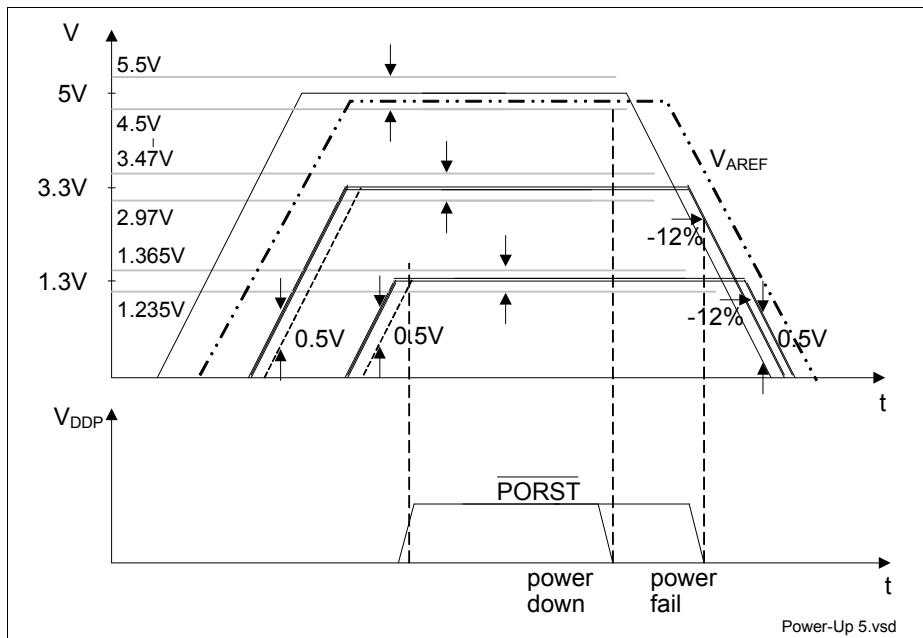

Figure 13 5 V / 3.3 V / 1.3 V Power-Up/Down Sequence for 10% Operating Range

## Electrical Parameters AC Parameters

**Figure 14 5 V / 3.3 V / 1.3 V Power-Up/Down Sequence for 5% Operating Range**

The following list of rules applies to the power-up/down sequence:

- All ground pins  $V_{SS}$  must be externally connected to one single star point in the system. Regarding the DC current component, all ground pins are internally directly connected.
- At any moment in time to avoid increased latch-up risk, each power supply must be higher than any lower\_power\_supply - 0.5 V, or:  $V_{DD5} > V_{DD3.3} - 0.5 \text{ V}$ ;  $V_{DD5} > V_{DD1.3} - 0.5 \text{ V}$ ;  $V_{DD3.3} > V_{DD1.3} - 0.5 \text{ V}$ , see [Figure 14](#).
  - The latch-up risk is minimized if the I/O currents are limited to:
    - 20 mA for one pin group
    - AND 100 mA for the completed device I/Os
    - AND additionally before power-up / after power-down:
      - 1 mA for one pin in inactive mode (0 V on all power supplies)
- During power-up and power-down, the voltage difference between the power supply pins of the same voltage (3.3 V, 1.3 V, and 5 V) with different names (for example  $V_{DDP}$ ,  $V_{DDFL3} \dots$ ), that are internally connected via diodes, must be lower than 100 mV. On the other hand, all power supply pins with the same name (for example all  $V_{DDP}$ ), are internally directly connected. It is recommended that the power pins of the same voltage are driven by a single power supply.

---

**Electrical ParametersAC Parameters**

1. The PORST signal may be deactivated after all  $V_{DD5}$ ,  $V_{DD3.3}$ ,  $V_{DD1.3}$ , and  $V_{AREF}$  power-supplies and the oscillator have reached stable operation, within the normal operating conditions.
2. At normal power down the PORST signal should be activated within the normal operating range, and then the power supplies may be switched off. Care must be taken that all Flash write or delete sequences have been completed.
3. At power fail the PORST signal must be activated at latest when any 3.3 V or 1.3 V power supply voltage falls 12% below the nominal level. If, under these conditions, the PORST is activated during a Flash write, only the memory row that was the target of the write at the moment of the power loss will contain unreliable content. In order to ensure clean power-down behavior, the PORST signal should be activated as close as possible to the normal operating voltage range.
4. In case of a power-loss at any power-supply, all power supplies must be powered-down, conforming at the same time to the rules number 2 and 4.
5. Although not necessary, it is additionally recommended that all power supplies are powered-up/down together in a controlled way, as tight to each other as possible.
6. Additionally, regarding the ADC reference voltage  $V_{AREF}$ :
  - $V_{AREF}$  must power-up at the same time or later than  $V_{DDM}$ , and
  - $V_{AREF}$  must power-down either earlier or at latest to satisfy the condition  $V_{AREF} < V_{DDM} + 0.5$  V. This is required in order to prevent discharge of  $V_{AREF}$  filter capacitance through the ESD diodes through the  $V_{DDM}$  power supply. In case of discharging the reference capacitance through the ESD diodes, the current must be lower than 5 mA.

## Electrical Parameters AC Parameters

## 5.3.3 Power, Pad and Reset Timing

**Table 33 Reset Timings Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Application Reset Boot Time <sup>1)2)</sup>	$t_B$ CC	150	—	810	μs	SAK-TC1782N-256F133HR SAK-TC1782N-256F133HL
		150	—	665	μs	SAK-TC1782F320F1 80HR SAK-TC1782F320F1 80HL SAK-TC1782N-320F180HR SAK-TC1782N-320F180HL
		150	—	740	μs	SAK-TC1782F-320F160HR SAK-TC1782F-320F160HL / S AK-TC1782N-320F160HR SAK-TC1782N-320F160HL
Power on Reset Boot Time <sup>3)4)</sup>	$t_{BP}$ CC	—	—	2.5	ms	
HWCFG pins hold time from ESR0 rising edge	$t_{HDH}$ SR	16 / $f_{FPI}$	—	—	ns	
HWCFG pins setup time to ESR0 rising edge	$t_{HDS}$ CC	0	—	—	ns	
Ports inactive after ESR0 reset active	$t_{PI}$ CC	—	—	$8 / f_{FPI}$	ns	
Ports inactive after PORST reset active <sup>5)</sup>	$t_{PIP}$ CC	—	—	150	ns	

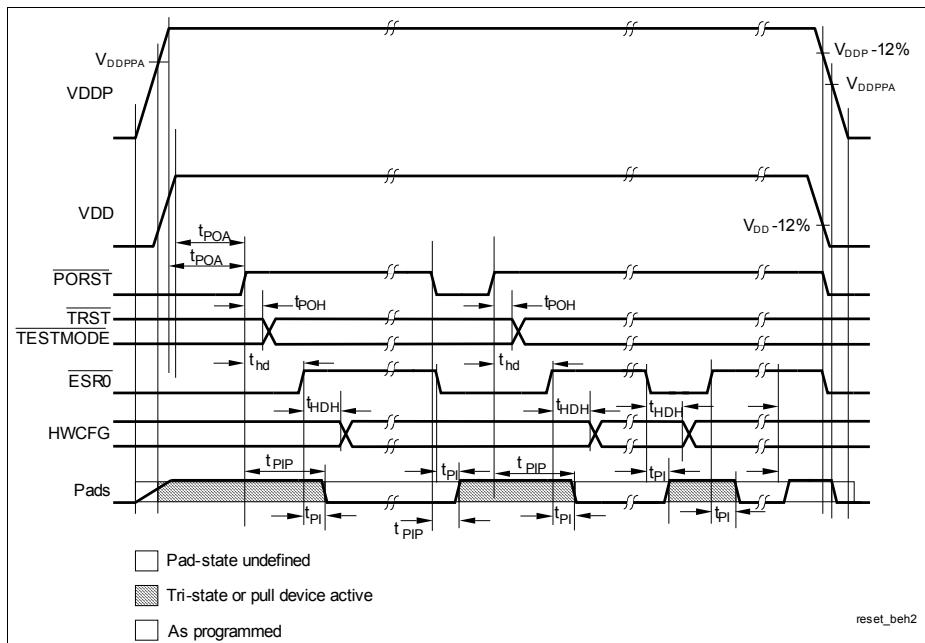

---

**Electrical ParametersAC Parameters**
**Table 33 Reset Timings Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Minimum PORST active time after power supplies are stable at operating levels	$t_{POA}$ CC	10	—	—	ms	
TESTMODE / TRST hold time from PORST rising edge	$t_{POH}$ SR	100	—	—	ns	
PORST rise time	$t_{POR}$ SR	—	—	50	ms	
TESTMODE / TRST setup time to PORST rising edge	$t_{POS}$ SR	0	—	—	ns	

- 1) The duration of the boot time is defined between the rising edge of the internal application reset and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.
- 2) The given time includes the time of the internal reset extension for a configured value of SCU\_RSTCNTCON.RELSA = 0x05BE.
- 3) The duration of the boot time is defined between the rising edge of the PORST and the clock cycle when the first user instruction has entered the CPU pipeline and its processing starts.
- 4) The given time includes the internal reset extension time for the System and Application Reset which is visible through ESR0.
- 5) This parameter includes the delay of the analog spike filter in the PORST pad.

## Electrical Parameters AC Parameters

PLL lock-in time	$t_L$ CC	14	–	200	$\mu s$	$N > 32$
		14	–	400	$\mu s$	$N \leq 32$

#### Phase Locked Loop Operation

When PLL operation is enabled and configured, the PLL clock  $f_{VCO}$  (and with it the LMB-Bus clock  $f_{LMB}$ ) is constantly adjusted to the selected frequency. The PLL is constantly adjusting its output frequency to correspond to the input frequency (from crystal or clock source), resulting in an accumulated jitter that is limited. This means that the relative deviation for periods of more than one clock cycle is lower than for a single clock cycle.

This is especially important for bus cycles using wait states and for the operation of timers, serial interfaces, etc. For all slower operations and longer periods (e.g. pulse train generation or measurement, lower baudrates, etc.) the deviation caused by the PLL jitter is negligible.

Two formulas are defined for the (absolute) approximate maximum value of jitter  $D_m$  in [ns] dependent on the K2 - factor, the LMB clock frequency  $f_{LMB}$  in [MHz], and the number  $m$  of consecutive  $f_{LMB}$  clock periods.

for  $(K2 \leq 100)$  and  $(m \leq (f_{LMB}[\text{MHz}])/2)$

$$|Dm[\text{ns}]| = \left( \frac{740}{K2 \times f_{LMB}[\text{MHz}]} + 5 \right) \times \left( \frac{(1 - 0,01 \times K2) \times (m - 1)}{0,5 \times f_{LMB}[\text{MHz}] - 1} + 0,01 \times K2 \right) \quad (6)$$

$$\text{else } |Dm[\text{ns}]| = \frac{740}{K2 \times f_{LMB}[\text{MHz}]} + 5 \quad (7)$$

With rising number  $m$  of clock cycles the maximum jitter increases linearly up to a value of  $m$  that is defined by the K2-factor of the PLL. Beyond this value of  $m$  the maximum

---

**Electrical ParametersAC Parameters**

accumulated jitter remains at a constant value. Further, a lower LMB-Bus clock frequency  $f_{LMB}$  results in a higher absolute maximum jitter value.

*Note: The specified PLL jitter values are valid if the capacitive load per pin does not exceed  $C_L = 20 \text{ pF}$  with the maximum driver and sharp edge.*

*Note: The maximum peak-to-peak noise on the pad supply voltage, measured between  $V_{DDOSC3}$  and  $V_{SSOSC}$ , is limited to a peak-to-peak voltage of  $V_{PP} = 100 \text{ mV}$  for noise frequencies below 300 KHz and  $V_{PP} = 40 \text{ mV}$  for noise frequencies above 300 KHz.*

*The maximum peak-to peak noise on the pad supply voltage, measured between  $V_{DDOSC}$  and  $V_{SSOSC}$ , is limited to a peak-to-peak voltage of  $V_{PP} = 100 \text{ mV}$  for noise frequencies below 300 KHz and  $V_{PP} = 40 \text{ mV}$  for noise frequencies above 300 KHz.*

*These conditions can be achieved by appropriate blocking of the supply voltage as near as possible to the supply pins and using PCB supply and ground planes.*

### Oscillator Watchdog (OSC\_WDT)

The expected input frequency is selected via the bit field SCU\_OSCCON.OSCVAL. The OSC\_WDT checks for too low frequencies and for too high frequencies.

The frequency that is monitored is  $f_{OSCREF}$  which is derived for  $f_{osc}$ .

$$f_{OSCREF} = \frac{f_{osc}}{OSCVAL + 1} \quad (8)$$

The divider value SCU\_OSCCON.OSCVAL has to be selected in a way that  $f_{OSCREF}$  is 2.5 MHz.

*Note:  $f_{OSCREF}$  has to be within the range of 2 MHz to 3 MHz and should be as close as possible to 2.5 MHz.*

The monitored frequency is too low if it is below 1.25 MHz and too high if it is above 7.5 MHz. This leads to the following two conditions:

- Too low:  $f_{osc} < 1.25 \text{ MHz} \times (\text{SCU\_OSCCON.OSCVAL} + 1)$
- Too high:  $f_{osc} > 7.5 \text{ MHz} \times (\text{SCU\_OSCCON.OSCVAL} + 1)$

*Note: The accuracy is 30% for these boundaries.*

---

**Electrical ParametersAC Parameters**
**5.3.5 ERAY Phase Locked Loop (ERAY\_PLL)**
**Table 35 PLL\_ERAY Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Accumulated jitter at SYSCLK pin	$D_{PP}$ CC	-0.8	–	0.8	ns	
Accumulated_Jitter	$D_P$ CC	-0.5	–	0.5	ns	
PLL Base Frequency of the ERAY PLL	$f_{PLLBASE\_ERAY}$ CC	50	250	360	MHz	
VCO input frequency of the ERAY PLL	$f_{REF}$ CC	20	–	40	MHz	
VCO frequency range of the ERAY PLL	$f_{VCO\_ERA\_Y}$ CC	450	–	500	MHz	
PLL lock-in time	$t_L$ CC	5.6	–	200	μs	

*Note: The specified PLL jitter values are valid if the capacitive load per pin does not exceed  $C_L = 20 \text{ pF}$  with the maximum driver and sharp edge.*

*Note: The maximum peak-to-peak noise on the pad supply voltage, measured between  $V_{DDOSC3}$  and  $V_{SSOSC}$ , is limited to a peak-to-peak voltage of  $V_{PP} = 100 \text{ mV}$  for noise frequencies below 300 KHz and  $V_{PP} = 40 \text{ mV}$  for noise frequencies above 300 KHz.*

*These conditions can be achieved by appropriate blocking of the supply voltage as near as possible to the supply pins and using PCB supply and ground planes.*

### 5.3.6 JTAG Interface Timing

The following parameters are applicable for communication through the JTAG debug interface. The JTAG module is fully compliant with IEEE1149.1-2000.

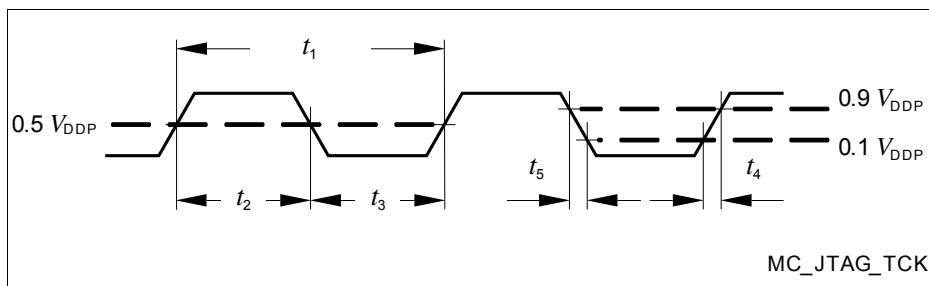

*Note: These parameters are not subject to production test but verified by design and/or characterization.*

**Table 36 JTAG Interface Timing Parameters  
(Operating Conditions apply)**

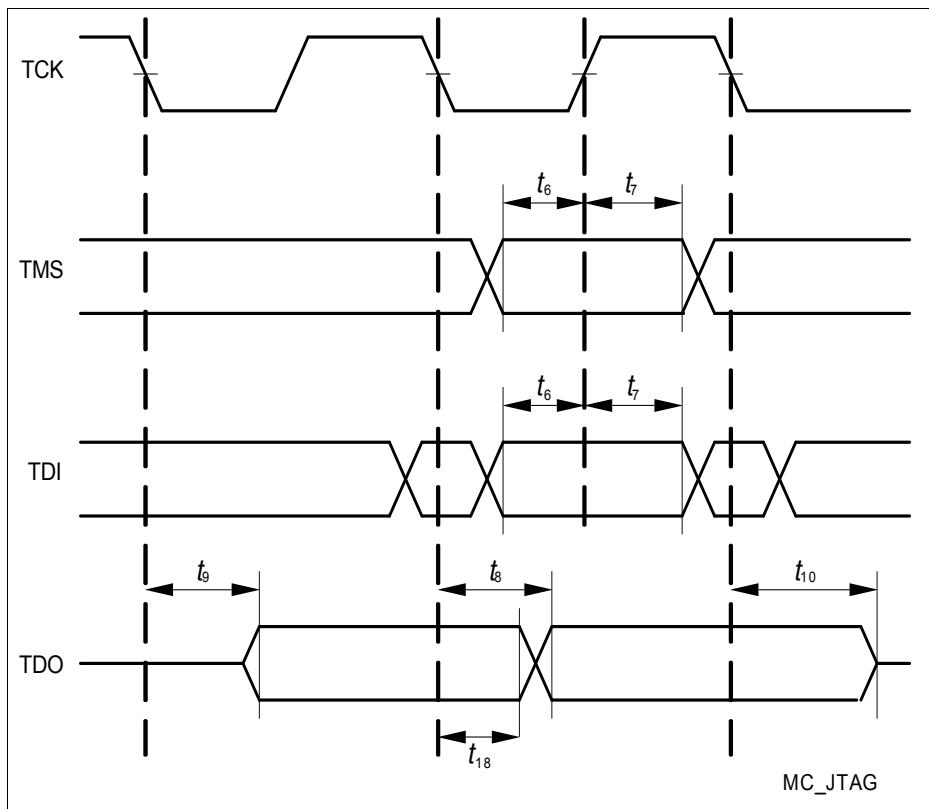

<b>Parameter</b>	<b>Symbol</b>	<b>Values</b>			<b>Unit</b>	<b>Note / Test Condition</b>
		<b>Min.</b>	<b>Typ.</b>	<b>Max.</b>		
TCK clock period	$t_1$ SR	25	—	—	ns	—
TCK high time	$t_2$ SR	10	—	—	ns	—
TCK low time	$t_3$ SR	10	—	—	ns	—
TCK clock rise time	$t_4$ SR	—	—	4	ns	—
TCK clock fall time	$t_5$ SR	—	—	4	ns	—
TDI/TMS setup to TCK rising edge	$t_6$ SR	6	—	—	ns	—
TDI/TMS hold after TCK rising edge	$t_7$ SR	6	—	—	ns	—
TDO valid after TCK falling edge <sup>1)</sup> (propagation delay)	$t_8$ CC	—	—	13	ns	$C_L = 50 \text{ pF}$
	$t_8$ CC	3	—	—	ns	$C_L = 20 \text{ pF}$
TDO hold after TCK falling edge <sup>1)</sup>	$t_{18}$ CC	2	—	—	ns	
TDO high imped. to valid from TCK falling edge <sup>1,2)</sup>	$t_9$ CC	—	—	14	ns	$C_L = 50 \text{ pF}$
TDO valid to high imped. from TCK falling edge <sup>1)</sup>	$t_{10}$ CC	—	—	13.5	ns	$C_L = 50 \text{ pF}$

1) The falling edge on TCK is used to generate the TDO timing.

2) The setup time for TDO is given implicitly by the TCK cycle time.

## Electrical Parameters AC Parameters

## 5.3.7 DAP Interface Timing

The following parameters are applicable for communication through the DAP debug interface.

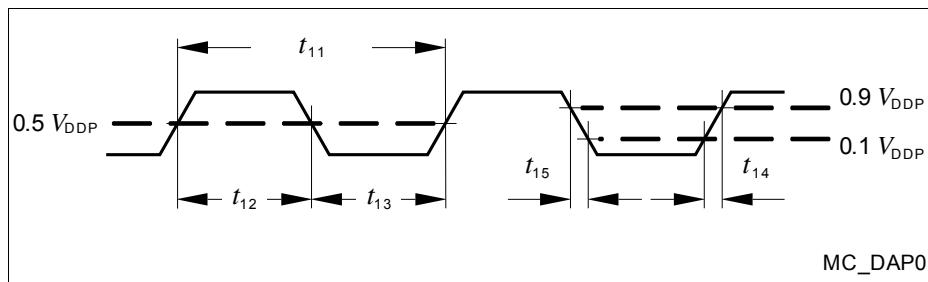

*Note: These parameters are not subject to production test but verified by design and/or characterization.*

**Table 37 DAP Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
DAP0 clock period <sup>1)</sup>	$t_{TCK}$ SR	12.5	—	—	ns	
DAP0 high time	$t_{12}$ SR	4	—	—	ns	
DAP0 low time <sup>1)</sup>	$t_{13}$ SR	4	—	—	ns	
DAP0 clock rise time	$t_{14}$ SR	—	—	2	ns	
DAP0 clock fall time	$t_{15}$ SR	—	—	2	ns	
DAP1 setup to DAP0 rising edge	$t_{16}$ SR	6.0	—	—	ns	
DAP1 hold after DAP0 rising edge	$t_{17}$ SR	6.0	—	—	ns	
DAP1 valid per DAP0 clock period <sup>2)</sup>	$t_{19}$ CC	8	—	—	ns	$C_L = 20 \text{ pF}; f = 80 \text{ MHz}$
		10	—	—	ns	$C_L = 50 \text{ pF}; f = 40 \text{ MHz}$

1) See the DAP chapter for clock rate restrictions in the Active:IDLE protocol state.

2) The Host has to find a suitable sampling point by analyzing the sync telegram response.

**Figure 18 Test Clock Timing (DAP0)**

## Electrical Parameters AC Parameters

## Electrical Parameters AC Parameters

### 5.3.8 Peripheral Timings

*Note: Peripheral timing parameters are not subject to production test. They are verified by design/characterization.*

#### 5.3.8.1 Micro Link Interface (MLI) Timing

**Figure 21 MLI Interface Timing**

*Note: The generation of RREADYx is in the input clock domain of the receiver. The reception of TREADYx is asynchronous to TCLKx.*

## Electrical Parameters AC Parameters

The MLI parameters are valid for  $C_L = 50 \text{ pF}$  and for strong driver medium edge.

**Table 38 MLI Receiver**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
RCLK clock period	$t_{20}$ SR	$1 / f_{\text{FPI}}$	—	—	ns	
RCLK high time <sup>1)2)</sup>	$t_{21}$ SR	—	$0.5 \times t_{20}$	—	ns	
RCLK low time <sup>1)2)</sup>	$t_{22}$ SR	—	$0.5 \times t_{20}$	—	ns	
RCLK rise time <sup>3)</sup>	$t_{23}$ SR	—	—	4	ns	
RCLK fall time <sup>3)</sup>	$t_{24}$ SR	—	—	4	ns	
RDATA/RVALID setup time before RCLK falling edge	$t_{25}$ SR	4.2	—	—	ns	
RDATA/RVALID hold time after RCLK falling edge	$t_{26}$ CC	2.2	—	—	ns	
RREADY output delay time	$t_{27}$ CC	0	—	16	ns	

1) The following formula is valid:  $t_{21} + t_{22} = t_{20}$ .

2) Min and Max values for this parameter can be derived from the typ. value by considering the other receiver timing parameters.

3) The RCLK max. input rise/fall times are best case parameters for fSYS = 90 MHz. For reduction of EMI, slower input signal rise/fall times can be used for longer RCLK clock periods.

**Table 39 MLI Transmitter**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCLK clock period	$t_{10}$ CC	$2 \times 1 / f_{\text{FPI}}$	—	—	ns	
TCLK high time <sup>1)2)</sup>	$t_{11}$ CC	$0.45 \times t_{10}$	$0.5 \times t_{10}$	$0.55 \times t_{10}$	ns	
TCLK low time <sup>1)2)</sup>	$t_{12}$ CC	$0.45 \times t_{10}$	$0.5 \times t_{10}$	$0.55 \times t_{10}$	ns	
TCLK rise time	$t_{13}$ CC	—	—	$0.3 \times t_{10}^{3)}$	ns	

**Electrical ParametersAC Parameters**
**Table 39 MLI Transmitter (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCLK fall time	$t_{14}$ CC	—	—	$0.3 \times t_{10}^{(3)}$	ns	
TDATA/TVALID output delay time	$t_{15}$ CC	-3	—	4.4	ns	
TREADY setup time before TCLK rising edge	$t_{16}$ SR	18	—	—	ns	
TREADY hold time after TCLK rising edge	$t_{17}$ SR	-2	—	—	ns	

- 1) The following formula is valid:  $t_{11} + t_{12} = t_{10}$ .
- 2) The min./max. TCLK low/high times  $t_{11}/t_{12}$  include the PLL jitter of fSYS. Fractional divider settings must be regarded additionally to  $t_{11} / t_{12}$ .
- 3) For high-speed MLI interface, strong driver sharp or medium edge selection (class A2 pad) is recommended for TCLK.

### 5.3.8.2 Micro Second Channel (MSC) Interface Timing

The MSC parameters are valid for  $C_L = 50 \text{ pF}$ .

**Table 40 MSC Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
FCLP clock period <sup>1)(2)</sup>	$t_{40}$ CC	$2 \times T_{\text{MSC}}^{(3)}$	—	—	ns	
SOP <sup>4)</sup> /ENx outputs delay from FCLP <sup>4)</sup> rising edge	$t_{45}$ CC	-2	—	5	ns	ENx with strong driver and sharp (minus) edge
		-2	—	10	ns	ENx with strong driver and medium (minus) edge
		0	—	21	ns	ENx with strong driver and soft edge

## Electrical Parameters AC Parameters

**Table 40 MSC Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SDI bit time	$t_{46}$ CC	$8 \times T_{MSC}$	—	—	ns	
SDI rise time <sup>5)</sup>	$t_{48}$ SR	—	—	200	ns	
SDI fall time <sup>5)</sup>	$t_{49}$ SR	—	—	200	ns	

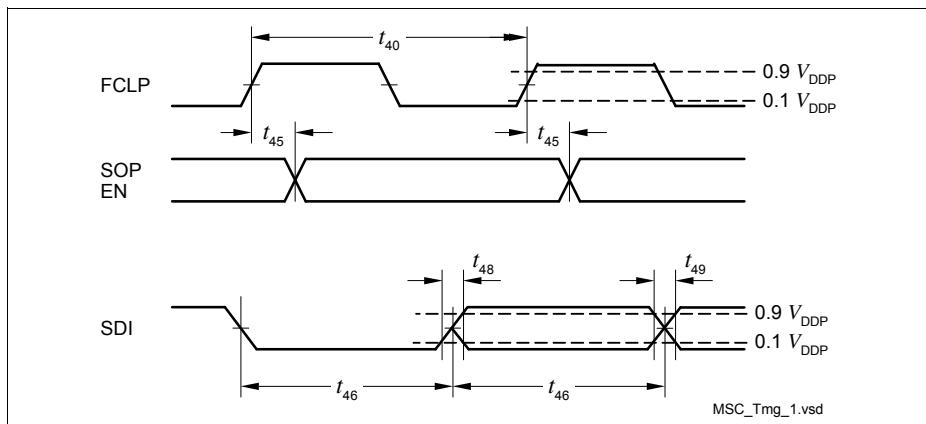

1) FCLP signal rise/fall times are only defined by the pad rise/fall times.

2) FCLP signal high and low can be minimum  $1 \times T_{MSC}$

3) TMSC = TSYS = 1 / fSYS.

4) SOP / FCLP either propagated by LVDS or by CMOS strong driver and non soft edge.

5) When using slow and asymmetrical edges, like in case of open drain upstream connection, the application must take care that the bit is long enough (the baud rate is low enough) so that under worst case conditions the three sampling points in the middle of the bit are not violated.

**Figure 22 MSC Interface Timing**

*Note: The data at SOP should be sampled with the falling edge of FCLP in the target device.*

---

**Electrical ParametersAC Parameters**

### 5.3.8.3 SSC Master/Slave Mode Timing

The SSC parameters are valid for  $C_L = 50 \text{ pF}$  and for strong driver medium edge.

**Table 41 SSC Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SCLK clock period <sup>1)2)3)</sup>	$t_{50}$ CC	$2 \times 1 / f_{\text{FPI}}$	—	—	ns	
MTSR/SLSOx delay from SCLK rising edge	$t_{51}$ CC	0	—	8	ns	
MRST setup to SCLK falling edge <sup>3)</sup>	$t_{52}$ SR	16.5	—	—	ns	
MRST hold from SCLK falling edge <sup>3)</sup>	$t_{53}$ SR	0	—	—	ns	
SCLK input clock period <sup>1)3)</sup>	$t_{54}$ SR	$4 \times 1 / f_{\text{FPI}}$	—	—	ns	
SCLK input clock duty cycle	$t_{55} - t_{54}$ SR	45	—	55	%	
MTSR setup to SCLK latching edge <sup>3)4)</sup>	$t_{56}$ CC	$1 / f_{\text{FPI}}$	—	—	ns	
MTSR hold from SCLK latching edge	$t_{57}$ CC	$1 / f_{\text{FPI}} + 5$	—	—	ns	
SLSI setup to first SCLK latching edge	$t_{58}$ CC	$1 / f_{\text{FPI}} + 5$	—	—	ns	
SLSI hold from last SCLK latching edge <sup>5)</sup>	$t_{59}$ CC	7	—	—	ns	
MRST delay from SCLK shift edge	$t_{60}$ CC	0	—	16.5	ns	
SLSI to valid data on MRST	$t_{61}$ CC	—	—	16.5	ns	

1) SCLK signal rise/fall times are the same as the rise/fall times of the pad.

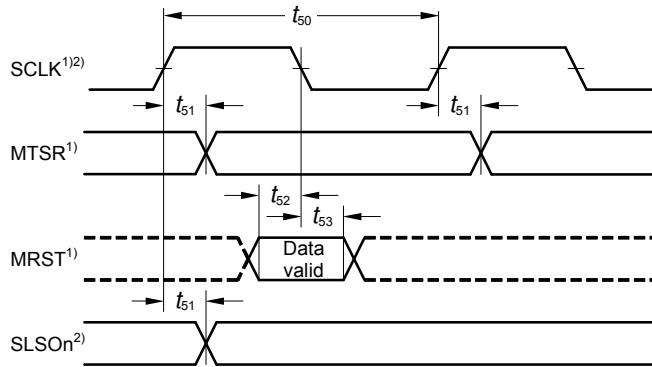

2) SCLK signal high and low times can be minimum  $1 \times \text{TSSC}$ .

3)  $\text{TSSC}_{\min} = \text{TSYS} = 1/\text{fSYS}$ .

4) Fractional divider switched off, SSC internal baud rate generation used.

5) For CON.PH=1 slave select must not be removed before the following shifting edge. This means, that whatever is configured (shifting / latching first), SLSI must not be de-activated before the last trailing edge from the pair of shifting / latching edges.

## Electrical Parameters AC Parameters

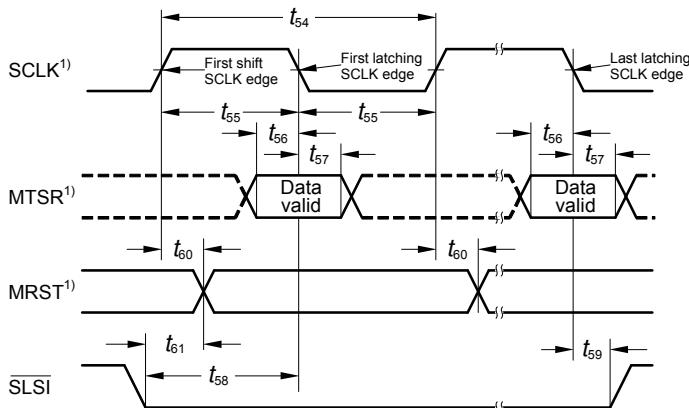

1) This timing is based on the following setup: CON.PH = CON.PO = 0.

2) The transition at SLSOn is based on the following setup: SSOTC.TRAILING = 0 and the first SCLK high pulse is in the first one of a transmission.

SSC\_TmgMM

**Figure 23 SSC Master Mode Timing**

1) This timing is based on the following setup: CON.PH = CON.PO = 0.

SSC\_TmgSM

**Figure 24 SSC Slave Mode Timing**

---

**Electrical Parameters AC Parameters**

### 5.3.8.4 ERAY Interface Timing

The timings of this section are valid for the strong driver and either sharp edge or medium edge settings of the output drivers with  $C_L = 25 \text{ pF}$ .

The ERAY interface is only available for the SAK-TC1782F-320F180HR / SAK-TC1782F-320F180HL / SAK-TC1782F-320F160HR / SAK-TC1782F-320F160HL / SAK-TC1782F-320F133HR / SAK-TC1782F-320F133HL.

**Table 42 ERAY Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Time span from last BSS to FES without the influence of quartz tolerancies (d10Bit_TX) <sup>1)</sup>	$t_{60}$ CC	997.75	—	1002.25	ns	
TxD data valid from fsample flip flop txd_reg TxDA, TxDB (dTxAAsym) <sup>2)3)</sup>	$t_{61}-t_{62}$ CC	—	—	1.5	ns	Asymmetrical delay of rising and falling edge (TxDA, TxDB)
Time span between last BSS and FES without influence of quartz tolerancies (d10Bit_RX) <sup>1)4)5)</sup>	$t_{63}$ SR	966	—	1046.1	ns	
RxD capture by fsample (RxDA/RxDB sampling flip-flop) (dRxAsym) <sup>5)</sup>	$t_{64}-t_{65}$ CC	—	—	3.0	ns	Asymmetrical delay of rising and falling edge (RxDA, RxDB)
TxD data delay from sampling flip-flop	$dTxddy$ CC	—	—	10.0	ns	$Px\_PDR.PDy = 000_B$
		—	—	15.0	ns	$Px\_PDR.PDy = 001_B$
RxD capture delay by sampling flip-flop	$dRxdly$ CC	—	—	10.0	ns	

1) This includes the PLL\_ERAY accumulated jitter.

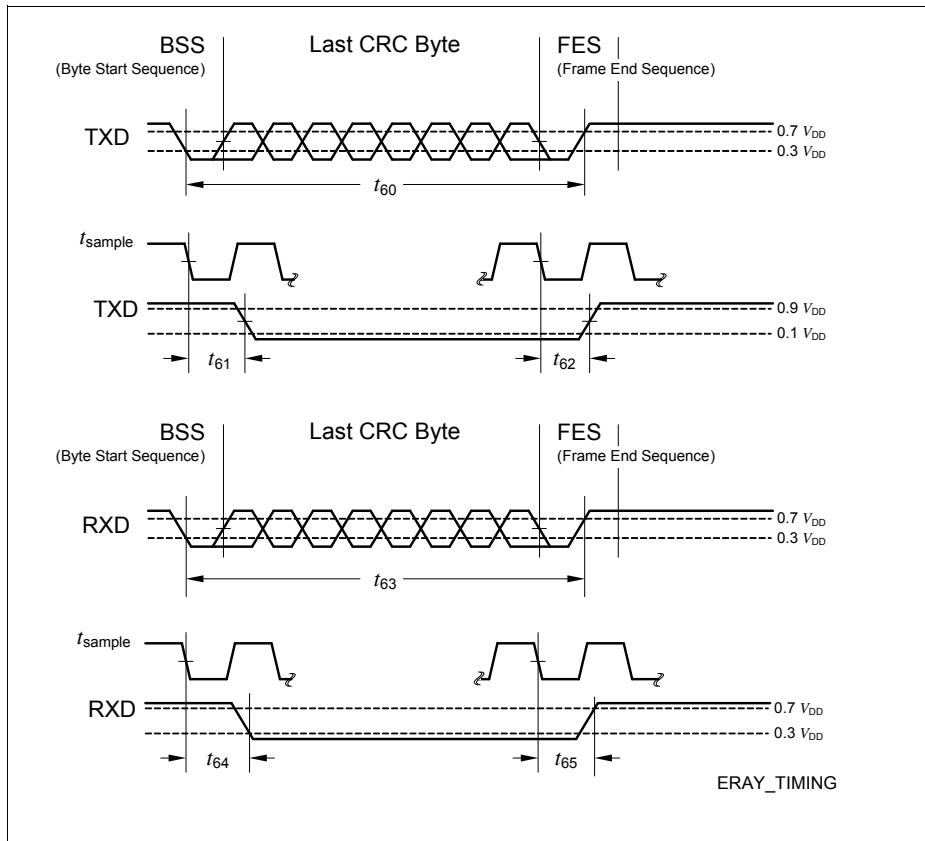

2) Refers to delays caused by the asymmetries of the output drivers of the digital logic and the GPIO pad drivers. Quartz tolerance and PLL\_ERAY accumulated jitter are not included.

3) E-Ray TxD output drivers have an asymmetry of rising and falling edges of  $|t_{FA2} - t_{RA2}| \leq 1 \text{ ns}$ .

4) Limits of 966ns and 1046.1ns correspond to (30%, 70%) \*  $V_{DDP}$  FlexRay standard input thresholds. For input thresholds of this product, a correction of - 0.5 ns and +0.1 ns has to be applied.

## Electrical Parameters AC Parameters

- 5) Valid for output slopes of the bus driver of  $dRxSlope \leq 5\text{ns}$ ,  $20\% * V_{DDP}$  to  $80\% * V_{DDP}$ , according to the FlexRay Electrical Physical Layer Specification V2.1B. For A2 pads, the rise and fall times of the incoming signal have to satisfy the following inequality:  $-1.6\text{ns} \leq t_{FA2} - t_{RA2} \leq 1.3\text{ns}$ .

**Figure 25 ERAY Timing**

---

**Electrical Parameters Package and Reliability**

## 5.4 Package and Reliability

### 5.4.1 Package Parameters

**Table 43 Thermal Characteristics of the Package**

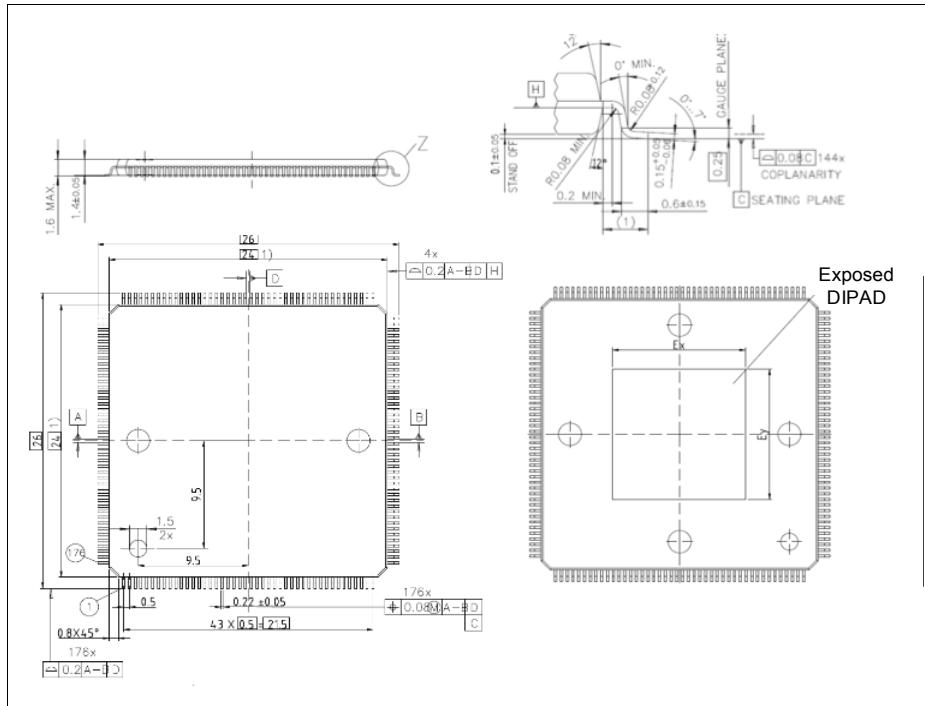

Device	Package	R <sub>θJCT</sub> <sup>1)</sup>	R <sub>θJCB</sub> <sup>1)</sup>	R <sub>θJLead</sub>	Unit	Note
TC1782	PG-LQFP-176-10 / PG-LQFP-176-20	8,1	0,3	30,9	K/W	with soldered exposed pad <sup>2)</sup>
TC1782	PG-LQFP-176-10 / PG-LQFP-176-20	8,1	12,6	30,9	K/W	with not soldered exposed pad

1) The top and bottom thermal resistances between the case and the ambient ( $R_{TCAT}$ ,  $R_{TCAB}$ ) are to be combined with the thermal resistances between the junction and the case given above ( $R_{TJCT}$ ,  $R_{TJCB}$ ), in order to calculate the total thermal resistance between the junction and the ambient ( $R_{TJA}$ ). The thermal resistances between the case and the ambient ( $R_{TCAT}$ ,  $R_{TCAB}$ ) depend on the external system (PCB, case) characteristics, and are under user responsibility.

The junction temperature can be calculated using the following equation:  $T_J = T_A + R_{TJA} \times P_D$ , where the  $R_{TJA}$  is the total thermal resistance between the junction and the ambient. This total junction ambient resistance  $R_{TJA}$  can be obtained from the upper four partial thermal resistances.

Thermal resistances as measured by the 'cold plate method' (MIL SPEC-883 Method 1012.1).

- 2) It is recommended by Infineon Technologies AG to connect the exposed pad.

UCB Retention Time <sup>5)6)</sup>	$t_{RTU}$ CC	20	–	–	year s	Max. 4 erase/program cycles per UCB
Wake-Up time	$t_{WU}$ CC	–	–	270	μs	

## Electrical Parameters Package and Reliability

**Table 45    FLASH32 Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
DFlash wait state configuration	$WS_{DF}$ CC	$50\text{ ns} \times f_{FSI}$	—	—		
PFlash wait state configuration	$WS_{PF}$ CC	$26\text{ ns} \times f_{FSI}$	—	—		

- 1) In case of wordline oriented defects (see robust EEPROM emulation in the User's Manual) this erase time can increase by up to 100%.
- 2) In case the Program Verify feature detects weak bits, these bits will be programmed up to twice more. Each reprogramming takes additional 5 ms.
- 3) In case the Program Verify feature detects weak bits, these bits will be programmed once more. The reprogramming takes additional 5 ms.
- 4) Only valid when a robust EEPROM emulation algorithm is used. For more details see the User's Manual.
- 5) Storage and inactive time included.
- 6) At average weighted junction temperature  $T_j = 100^\circ\text{C}$ , or the retention time at average weighted temperature of  $T_j = 110^\circ\text{C}$  is minimum 10 years, or the retention time at average weighted temperature of  $T_j = 150^\circ\text{C}$  is minimum 0.7 years.

### 5.4.4    Quality Declarations

**Table 46    Quality Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Operation Lifetime <sup>1)</sup>	$t_{OP}$	—	—	24000	hours	<sup>—2)</sup>
ESD susceptibility according to Human Body Model (HBM)	$V_{HBM}$	—	—	2000	V	Conforming to JESD22-A114-B
ESD susceptibility of the LVDS pins	$V_{HBM1}$	—	—	500	V	—
ESD susceptibility according to Charged Device Model (CDM)	$V_{CDM}$	—	—	500	V	Conforming to JESD22-C101-C
Moisture Sensitivity Level	MSL	—	—	3	—	Conforming to Jedec J-STD-020C for 240°C

---

## Electrical ParametersPackage and Reliability

1) This lifetime refers only to the time when the device is powered on.

2) For worst-case temperature profile equivalent to:

1200 hours at  $T_j = 125\ldots 150^\circ\text{C}$

3600 hours at  $T_j = 110\ldots 125^\circ\text{C}$

7200 hours at  $T_j = 100\ldots 110^\circ\text{C}$

11000 hours at  $T_j = 25\ldots 100^\circ\text{C}$

1000 hours at  $T_j = -40\ldots 25^\circ\text{C}$

---

## History

### 6 History

The following changes where done between Version 0.7 and 0.8 of this document:

- Change product name from SAK-TC1782-320F180HL to SAK-TC1782-320F180HR
- Change product name from SAK-TC1782-256F133HL to SAK-TC1782-256F133HR
- Change DFLASH size from 64Kbyte to 128Kbyte in chapter 1
- Add ADC module abbreviation to table 1 Analog Input Port Function description
- Change SCU\_RTID and SCU\_CHIPID values to match the step
- Extend  $V_{DDOSC_3}$  to -7.5 %
- Add parameter  $HYSA1+$
- Add parameter  $HYSA2$
- Add parameter  $V_{ILF} / V_{IHF}$
- Add parameter  $R_{DSONF}$
- Changed typical value of  $C_{AINSW}$  from 7 to 9 pF
- Changed typical value of  $C_{AINTOT}$  from 25 to 20 pF
- Remove 3.3 V values from ADC section
- Add parameter  $f_{ADC}$
- Changed max. value of  $f_{ADCI}$  from 20 to 18 MHz
- Remove parameter  $I_{AIN7T}$  (covered by  $R_{AIN7T}$ )
- Replace parameter  $I_{AREF}$  by  $Q_{CONV}$
- Changed typical value of  $R_{AIN}$  from 700 to 900 Ohm
- Add parameter  $t_S$
- Add footnote to max value of  $TUE$
- Add parameter  $f_{FADC}$
- Add parameter  $t_C$
- Add formula for DTS temperature calculation
- Adapt current values to reduced limits of BA step
- Add clarification to parameter  $I_{LVDS}$
- Remove parameter  $R_{THJA}$  (not required)
- Add clarification to parameter  $t_{POH}$  description
- Add clarification to parameter  $t_{POS}$  description
- Add min. value to parameters  $t_L$
- Changed typical value of  $f_{PLLBASE_ERAY}$  from 200 to 250 MHz
- Add MSC  $t_{45}$  behavior for CMOS 7 LVDS usage
- Add  $R_{THS}$  for non soldered exposed pad
- Add table 33
- Change DTS accuracy to 6°C of the complete temperature range
- Remove limitations of the DFLASH and PFLASH operating in extended Range operating conditions
- Change package version von PG-LQFP-176-6 to PG-LQFP-176-12

The following changes where done between Version 0.8 and 1.0 of this document:

- Change package version von PG-LQFP-176-12 to PG-LQFP-176-10

---

## History

- improve description in table 2 for analog channels
- add class A1+ to type list of table 2
- add clarification that table 7 defines the conditions for all other parameters
- add note the spike filter is only available for the PORST pin
- add V<sub>il</sub> to V<sub>ih</sub> ratio for A1+ pad
- remove irritating Note / Test Conditions
- adapt maximum power dissipation values
- add conditions for MLI, MSC, SSC, parameters
- changed definition for t<sub>13</sub> and t<sub>14</sub> of the MLI timing
- changed definition for t<sub>45</sub> of the MSC timing
- add parameters dTx<sub>dl</sub> and dRx<sub>dl</sub> to ERAY parameters
- correct ERAY parameters t<sub>60</sub> and t<sub>63</sub> values
- correct footnotes for ERAY parameters
- split flash parameters t<sub>PRD</sub> and t<sub>PRP</sub> in two conditions
- add conditions to LVDS pad parameters
- Changed VAREFx to VAREFO and VAGNDx to VAGND0
- remove Pin Reliability in Overload section
- add parameters I<sub>IN</sub> and Sum I<sub>IN</sub> to absolute ratings
- adjust thresholds in figure 28 (ERAY)
- add parameter HYSX to PSC\_XTAL
- added RDSON values for all driver settings (weak, medium, and strong)
- removed footnote 2 of table 6
- change conditions for RDSON weak parameters
- change load for timing of SSC, MSC, and MLI from C<sub>L</sub> = 25 pF to C<sub>L</sub> = 50 pF (typical)
- add type I to legend of table 2
- add SAK-TC1782-320F180HL and SAK-TC1782-256F133HL
- changed timing checkpoints in figure 23
- add section 5.2.6.1
- add to parameters t<sub>RF</sub> and t<sub>FF</sub> condition C<sub>L</sub> = 50 pF
- add new footnote 7) to ADC parameter table
- add min and max value for Q<sub>CONV</sub> and adapt typ value
- add load conditions for t<sub>FF1</sub> and t<sub>RF1</sub>
- add conditions to PLL parameter t<sub>L</sub>
- change DAP parameter t<sub>19</sub> from SR to CC classification
- remove footnote 2 for the FADC
- increase current for I<sub>DDP\_POR</sub> from 2 to 2.5mA
- add footnote 3 to table 9
- change **SAK-TC1782-320F180HR / SAK-TC1782-320F180HL** to **SAK-TC1782F-320F180HR / SAK-TC1782F-320F180HL**
- change **SAK-TC1782-256F133HR / SAK-TC1782-256F133HL** to **SAK-TC1782F-256F133HR / SAK-TC1782F-256F133HL**
- add information for the following products:
  - **SAK-TC1782N-320F180HR**

---

## History

- SAK-TC1782N-320F180HL
- SAK-TC1182N-320F180HR
- SAK-TC1182N-320F180HL
- SAK-TC1782N-256F133HR
- SAK-TC1782N-256F133HL
- SAK-TC1182N-256F133HR
- SAK-TC1182N-156F133HL

The following changes where done between Version 1.0 and 1.1 of this document:

- add section Pin Reliability in Overload
- remove sentence 'Exposure to conditions within the maximum ratings will not affect device reliability. To replace this sentence section Pin Reliability in Overload was added.
- increase values for absolute maximum parameters  $I_{IN}$  and Sum $I_{IN}$
- remove capacitance conditions for LVDS pad parameters as loads are defined by interface (MSC) timings
- remove term typical from load of Peripheral Timings
- add definition of driver strength settings for ERAY Interface Timing
- change footnote 4 wording for ERAY timing back to TC1797 wording
- increase flash parameters  $t_{PRD}$  and  $t_{PRP}$  values
- rework the 3.3 V current part of the Power Supply Parameters for better description and usage
  - Parameters  $I_{DDP\_FP}$ ,  $I_{DDFL3E}$  and  $I_{DDFL3R}$  are removed and replaced in the following way
    - $I_{DDP\_FP}$  is replaced by  $I_{DDP}$  with the condition including flash programming current
    - $I_{DDFL3E}$  is replaced by  $I_{DDP}$  with the condition including flash erase verify current
    - $I_{DDFL3R}$  is replaced by  $I_{DDP}$  with the condition including flash read current
    - parameter  $I_{DDFL3R}$  was renamed to  $I_{DDFL3}$

The rework of the 3.3 V current part of the Power Supply Parameters was done for simplification and clarification. Former given values could still be used if liked, the new definition results in the same resulting values or slightly better values. The flash module is supplied via  $I_{DDFL3}$  and  $I_{DDP}$ . For the different flash operating modes in worst case different allocations for the two domains resulting.

The application typical case 'flash read' has max  $I_{DDP}$  of 12 mA and max  $I_{DDFL3}$  of 56 mA resulting is a sum of 68 mA.

The case 'flash programming' has max  $I_{DDP}$  of 27 mA and max  $I_{DDFL3}$  of 21 mA resulting is a sum of 48 mA.

The case 'flash erase verify' has max  $I_{DDP}$  of 20 mA and max  $I_{DDFL3}$  of 56 mA resulting is a sum of 76 mA.

So for the old parameter  $I_{DDP}$  with 15 mA, the new version reads as  $I_{DDP} = 12 + I_{DDP\_PORST} = 14.5$  mA for the same application relevant case.

The following changes where done between Version 1.1 and 1.2 of this document:

## History

- removed products SAK-TC1182N-320F180HR, SAK-TC1182N-320F180HL, SAK-TC1182N-256F133HR, and SAK-TC1182N-256F133HL
- improve parameters  $I_{DDFL3}$
- change for parameter  $N_E$  note from Max. data retention to Min.
- removed the term (typical)
- change description of parameter  $t_{CAL}$  for the ADC
- correct typo for class D pads in tables 14 and 15
- adapt Absolute Maximun Rating
- add footnote to Flash parameter  $t_{ERD}$
- add note at the end of Pin Reliability in Overload section
- clarify pad supply levels in Pin Reliability in Overload section
- add footnote for D-Flash currents in power section

The following changes where done between Version 1.2 and 1.3 of this document:

- add product option SAK-TC1782F-320F160HL, SAK-TC1782F-320F160HR, SAK-TC1782N-320F160HL and SAK-TC1782N-320F160HR
- update block diagrams to cover new option
- add identification registers for new product option
- rework first sentence for chapter 5.3
- reduce min value for  $t_L$  for both PLLs
- add for MLI and SSC parameter: valid strong driver medium edge only
- add footnote 5) for SSC parameters
- update FADC parameter  $EF_{DNL}$
- change MLI parameter  $t_{17}$  min value
- rename section Extended Range Operating Conditions to Voltage Operating timing Profiles and remove limitions on GPIOs
- split  $R_{DSONM}$  for class F pads into two conditions

The following changes where done between Version 1.3 and 1.3.1 of this document:

- correct typos in table 1
  - SAK-TC1782N-320N160HR -> SAK-TC1782F-320F160HR
  - SAK-TC1782N-320N160HL -> SAK-TC1782F-320F160HL
- reduce current for  $I_{LVDS}$  from 24mA to 12mA (only 2 pairs are available)

The following changes where done between Version 1.3.1 and 1.4 of this document:

- remove the following product options:
  - SAK-TC1782F-256F133HR
  - SAK-TC1782F-256F133HL
- change  $t_{48}$  from 100ns to 200ns in table 42
- change  $t_{49}$  from 100ns to 200ns in table 42
- extend  $K_{OVAN}$  conditon from  $I_{OV} \leq 0$  mA;  $I_{OV} \geq -1$  mA to  $I_{OV} \leq 0$  mA;  $I_{OV} \geq -2$  mA
- change parameter  $EF_{OFF}$  from +90mV to +120 for condition Calibration = No

The following changes where done between Version 1.4 and 1.4.1 of this document:

- change parameter  $EF_{OFF}$  from +120mV to +90 for condition Calibration = No
