AK4393
## Advanced Multi-Bit 96kHz 24-Bit 'Σ DAC

GENERAL DESCRIPTION

The AK4393 is a high performance stereo DAC for the 96kHz sampling mode of DAT, DVD including a 24bit digital filter. The AK4393 introduces the advanced multi-bit system for 'Σ modulator. This new architecture achieves the wider dynamic range, while keeping much the same superior distortion characteristics as conventional Single-Bit way. In the AK4393, the analog outputs are filtered in the analog domain by switched-capacitor filter (SCF) with high tolerance to clock jitter. The analog outputs are full differential output, so the device is suitable for hi-end applications. The operating voltages support analog 5V and digital 3.3V, so it is easy to I/F with 3.3V logic IC.
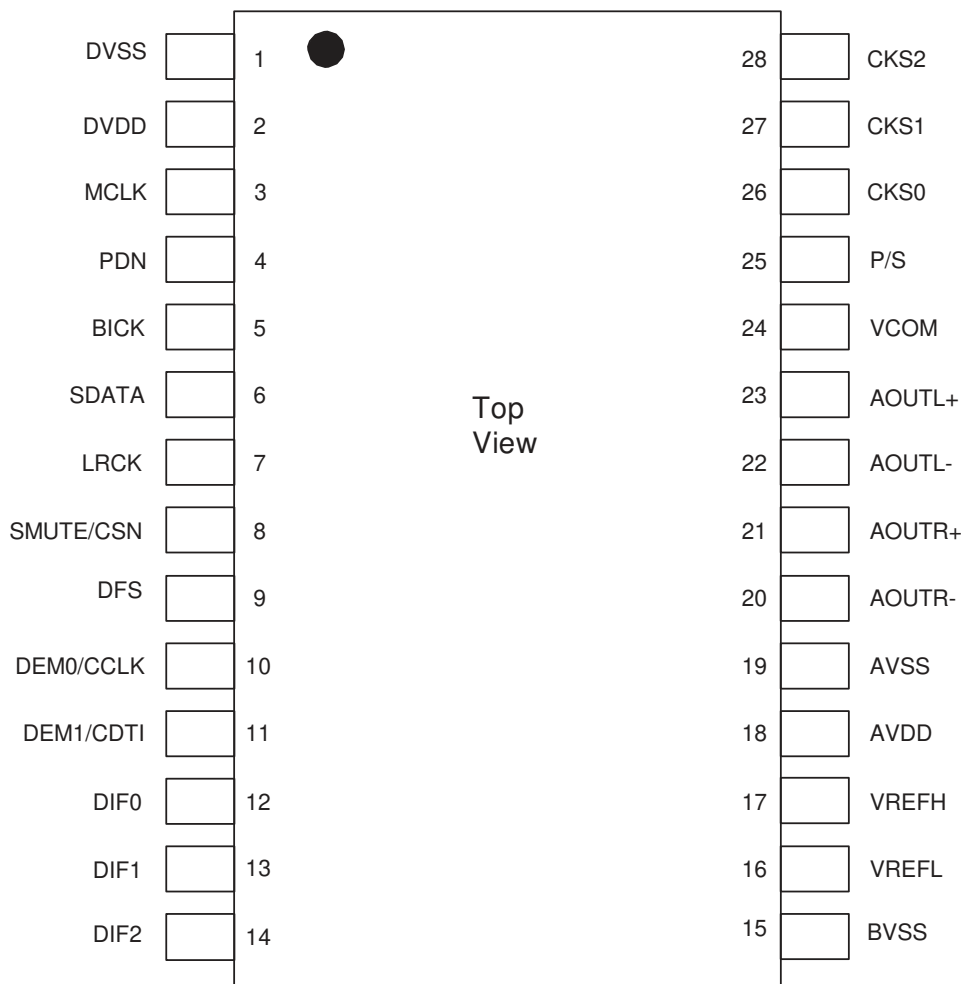

FEATURES

- x **128x Oversampling**
- x **Sampling Rate up to 108kHz**
- x **24Bit 8x Digital Filter**
    - **Ripple: r0.005dB, Attenuation: 75dB**
- x **High Tolerance to Clock Jitter**
- x **Low Distortion Differential Output**
- x **Digital de-emphasis for 32, 44.1, 48 & 96kHz sampling**
- x **Soft Mute**
- x **THD+N: -100dB**
- x **DR, S/N: 120dB**
- x **I/F format: MSB justified, 16/20/24bit LSB justified, I^{2}S**
- x **Master Clock: Normal Speed: 256fs, 384fs, 512fs or 768fs**
    - **Double Speed: 128fs, 192fs, 256fs or 384fs**
- x **Power Supply: 4.75 to 5.25V (Analog), 3 to 5.25V (Digital)**
- x **Small Package: 28pin SSOP**

PIN/FUNCTION

No.	Pin Name	I/O	Function
1	DVSS	-	Digital Ground Pin
2	DVDD	-	Digital Power Supply Pin, 3.3V or 5.0V
3	MCLK	I	Master Clock Input Pin

4	PDN	I	Power-Down Mode Pin
			    When at "L", the AK4393 is in power-down mode and is held in reset.
			    The AK4393 should always be reset upon power-up.

5	BICK	I	Audio Serial Data Clock Pin The clock of 64fs or more than is recommended to be input on this pin.
6	SDATA	I	Audio Serial Data Input Pin 2's complement MSB-first data is input on this pin.
7	LRCK	I	L/R Clock Pin

8	SMUTE	I	Soft Mute Pin in parallel mode
			    When this pin goes "H", soft mute cycle is initiated.
			    When returning "L", the output mute releases.

	CSN	I	Chip Select Pin in serial mode
9	DFS	I	Double Speed Sampling Mode Pin (Internal pull-down pin) "L": Normal Speed , "H": Double Speed
10	DEM0	I	De-emphasis Enable Pin in parallel mode
	CCLK	I	Control Data Clock Pin in serial mode
11	DEM1	I	De-emphasis Enable Pin in parallel mode
	CDTI	I	Control Data Input Pin in serial mode
12	DIF0	I	Digital Input Format Pin
13	DIF1	I	Digital Input Format Pin
14	DIF2	I	Digital Input Format Pin
15	BVSS	-	Substrate Ground Pin, 0V
16	VREFL	I	Low Level Voltage Reference Input Pin
17	VREFH	I	High Level Voltage Reference Input Pin
18	AVDD	-	Analog Power Supply Pin, 5.0V
19	AVSS	-	Analog Ground Pin, 0V
20	AOUTR-	O	Rch Negative analog output Pin
21	AOUTR+	O	Rch Positive analog output Pin
22	AOUTL-	O	Lch Negative analog output Pin
23	AOUTL+	O	Lch Positive analog output Pin
24	VCOM	O	Common Voltage Output Pin, 2.6V
25	P/S	I	Parallel/Serial Select Pin (Internal pull-up pin) "L": Serial control mode, "H": Parallel control mode
26	CKS0	I	Master Clock Select Pin
27	CKS1	I	Master Clock Select Pin
28	CKS2	I	Master Clock Select Pin

Note: All input pins except internal pull-up/down pins should not be left floating.

ABSOLUTE MAXIMUM RATINGS

(AVSS, BVSS, DVSS = 0V; Note 1)

Parameter		Symbol	min	max	Unit
Power Supplies:	Analog	AVDD	-0.3	6.0	V
	Digital	DVDD	-0.3	6.0	V
	|BVSS-DVSS| (Note 2)	˙ GND	-	0.3	V
Input Current , Any pin Except Supplies		IIN	-	r10	mA
Input Voltage		VIND	-0.3	DVDD+0.3	V
Ambient Operating Temperature		Ta	-40	85	qC
Storage Temperature		Tstg	-65	150	qC

Notes: 1. All voltages with respect to ground.
        2. AVSS, BVSS and DVSS must be connected to the same analog ground plane.

WARNING: Operation at or beyond these limits may result in permanent damage to the device.
        Normal operation is not guaranteed at these extremes.

RECOMMENDED OPERATING CONDITIONS

(AVSS, BVSS, DVSS=0V; Note 1)

Parameter		Symbol	min	typ	max	Unit
Power Supplies:	Analog	AVDD	4.75	5.0	5.25	V
(Note 3)	Digital	DVDD	3.0	3.3	5.25	V
Voltage Reference	"H" voltage reference	VREFH	AVDD-0.5	-	AVDD	V
(Note 4)	"L" voltage reference	VREFL	AVSS	-	-	V
	VREFH-VREFL	˙ VREF	3.0	-	AVDD	V

Notes: 3. The power up sequence between AVDD and DVDD is not critical.
        4. Analog output voltage scales with the voltage of (VREFH-VREFL).
           AOUT (typ.@0dB) = (AOUT+) - (AOUT-) = r2.4Vpp×(VREFH-VREFL)/5.

* AKM assumes no responsibility for the usage beyond the conditions in this data sheet.

Notes: 17. **For Double Speed mode please see Appendix A for relationship of MCLK and BCLK/LRCK.**

18. When the normal and double speed modes are switched, AK4393 should be reset by PDN pin or RSTN bit.

19. BICK rising edge must not occur at the same time as LRCK edge.

20. The AK4393 can be reset by bringing PDN "L" to "H".

When the states of CKS2-0 or DFS change, the AK4393 should be reset by PDN pin or RSTN bit.

Power-down Timing

OPERATION OVERVIEW

˝ System Clock

The external clocks, which are required to operate the AK4393, are MCLK, LRCK and BICK. The master clock (MCLK) should be synchronized with LRCK but the phase is not critical. **However, in Double Speed Mode, the phase relationship between MCLK and LRCK/BICK is limited. (Refer to Appendix A).** The MCLK is used to operate the digital interpolation filter and the delta-sigma modulator. The sampling speed is set by DFS (Table 1). The sampling rate (LRCK), CKS0/1/2 and DFS determine the frequency of MCLK (Table 2).

All external clocks (MCLK, BICK and LRCK) should always be present whenever the AK4393 is in normal operation mode (PDN = "H"). If these clocks are not provided, the AK4393 may draw excess current because the device utilizes dynamic refreshed logic internally. If the external clocks are not present, the AK4393 should be in the power-down mode (PDN = "L") or in the reset mode (RSTN = "0"). After exiting reset at power-up etc., the AK4393 is in power-down mode until MCLK and LRCK are input.

DFS	Sampling Rate (fs)	
0	Normal Speed Mode	30kHz~54kHz
1	Double Speed Mode	60kHz~108kHz

Default (for row 0)

Table 1. Sampling Speed

Mode	CKS2	CKS1	CKS0	Normal	Double
0	0	0	0	256fs	128fs
1	0	0	1	256fs	256fs
2	0	1	0	384fs	192fs
3	0	1	1	384fs	384fs
4	1	0	0	512fs	256fs
5	1	0	1	512fs	N/A
6	1	1	0	768fs	384fs
7	1	1	1	768fs	N/A

Default (for Mode 0)

Table 2. System Clocks

LRCK	MCLK				BICK

96.0kHz	12.2880MHz	18.4320MHz	24.5760MHz	36.8640MHz	6.1440MHz

Table 4. System clock example (Double Speed Mode)

„ **Audio Serial Interface Format**

Data is shifted in via the SDATA pin using BICK and LRCK inputs. Five data formats are supported and selected by the DIF0-2 as shown in Table 5. In all formats the serial data is MSB-first, 2's compliment format and is latched on the rising edge of BICK. Mode 2 can be used for 20 and 16 MSB justified formats by zeroing the unused LSBs.

Mode	DIF2	DIF1	DIF0	Mode	BICK	Figure
0	0	0	0	0: 16bit LSB Justified	t32fs	Figure 1
1	0	0	1	1: 20bit LSB Justified	t40fs	Figure 2
2	0	1	0	2: 24bit MSB Justified	t48fs	Figure 3
3	0	1	1	3: I^{2}S Compatible	t48fs	Figure 4

Table 5. Audio Data Formats
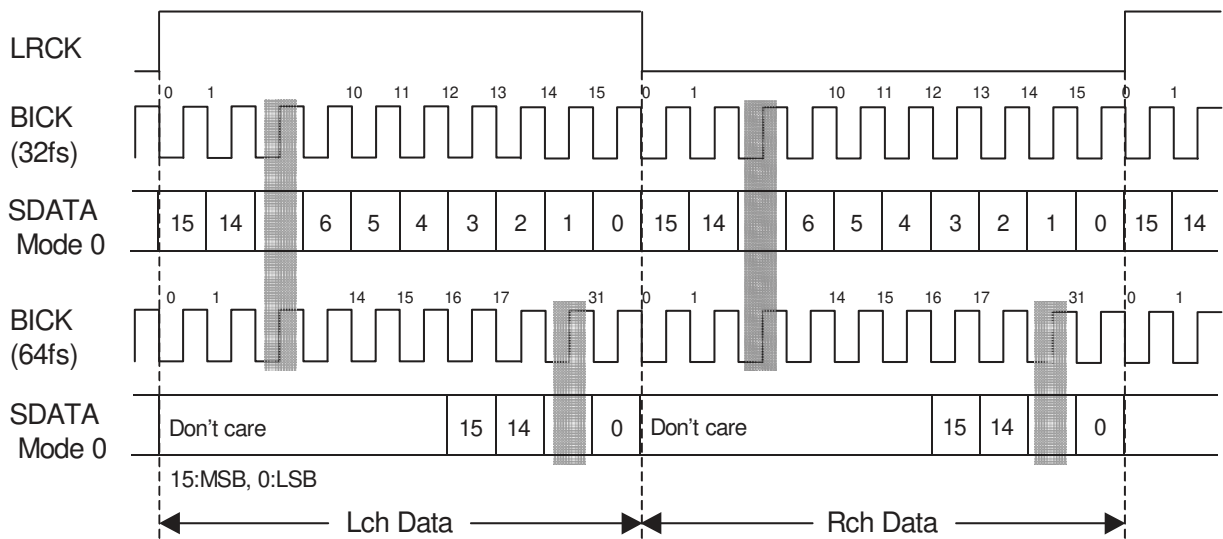

Figure 1. Mode 0 Timing
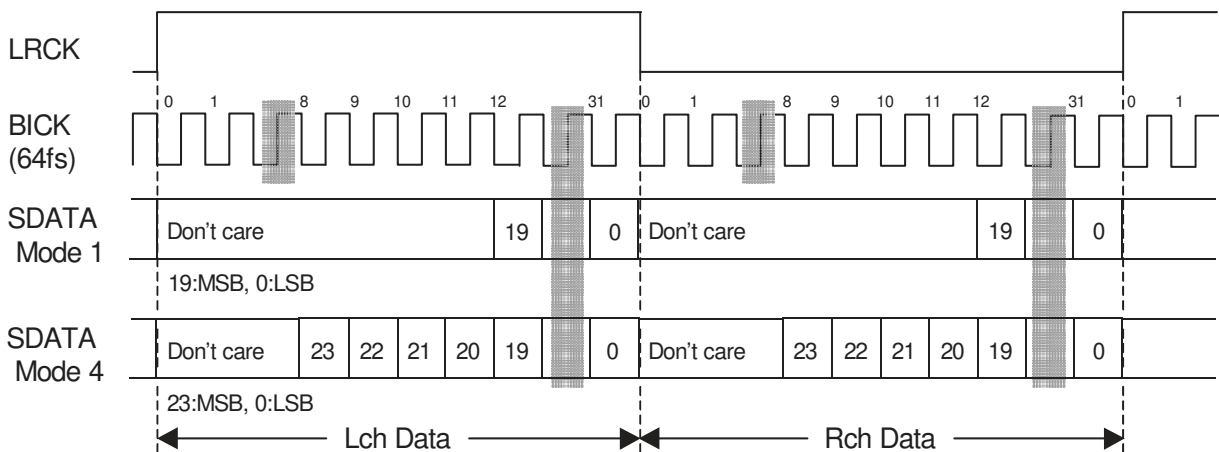

Figure 2. Mode 1,4 Timing
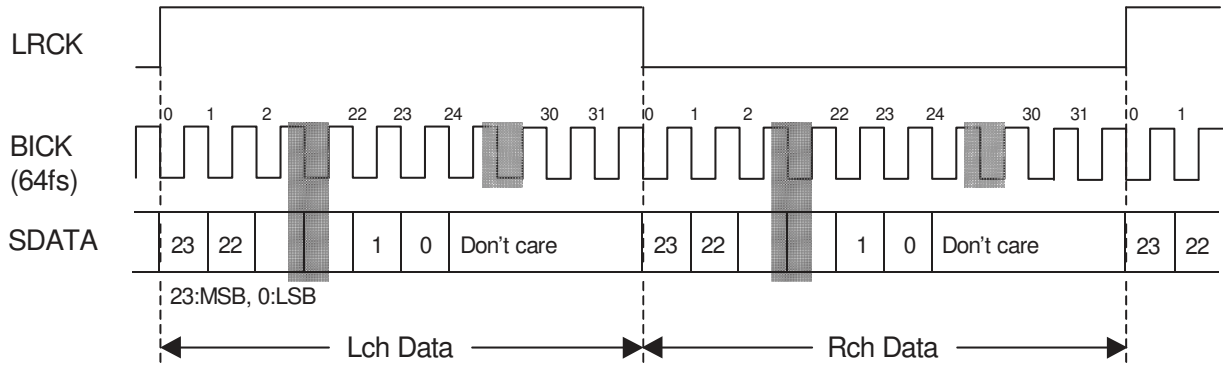

Figure 3. Mode 2 Timing
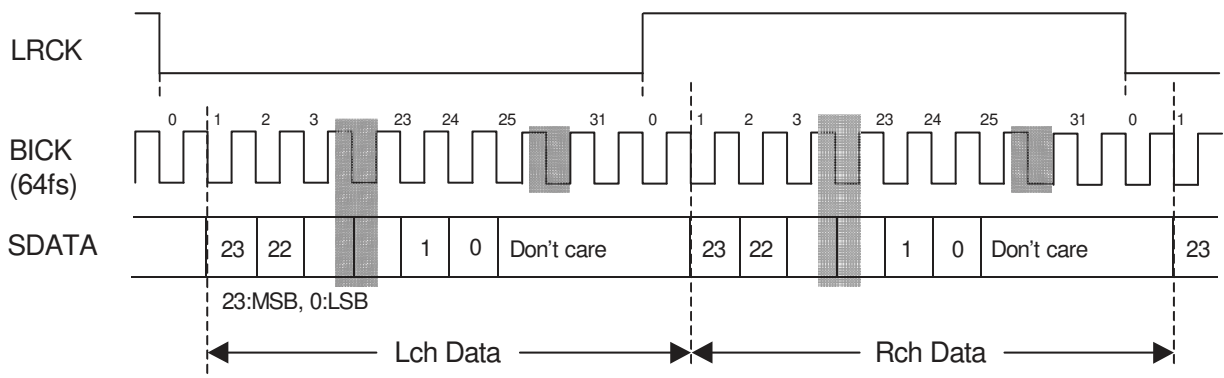

Figure 4. Mode 3 Timing

„ De-emphasis filter

A digital de-emphasis filter is available for 32, 44.1, 48 or 96kHz sampling rates (tc = 50/15µs) and is enabled or disabled with the DEM0, DEM1 and DFS input pins.

DEM1	DEM0	DFS	Mode	
0	0	0	44.1kHz	Default
0	1	0	OFF	
1	0	0	48kHz	
1	1	0	32kHz	
0	0	1	OFF	
0	1	1	OFF	
1	0	1	96kHz	
1	1	1	OFF	

Table 6. De-emphasis filter control

,, Soft mute operation

Soft mute operation is performed at digital domain. When SMUTE goes to "H", the output signal is attenuated by -∞ during 1024 LRCK cycles. When SMUTE is returned to "L", the mute is cancelled and the output attenuation gradually changes to 0dB during 1024 LRCK cycles. If the soft mute is cancelled within 1024 LRCK cycles after starting the operation, the attenuation is discontinued and returned to 0dB. The soft mute is effective for changing the signal source without stopping the signal transmission.
Notes:
    (1) The output signal is attenuated by -∞ during 1024 LRCK cycles (1024/fs).
    (2) Analog output corresponding to digital input has the group delay (GD).
    (3) If the soft mute is cancelled within 1024 LRCK cycles, the attenuation is discontinued and returned to 0dB.

Figure 5. Soft mute operation

„ **System Reset**

The AK4393 should be reset once by bringing PDN = "L" upon power-up. The AK4393 is powered up and the internal timing starts clocking by LRCK "n" after exiting reset and power down state by MCLK. The AK4393 is in the power-down mode until MCLK and LRCK are input.

„ **Power-Down**

The AK4393 is placed in the power-down mode by bringing PDN pin "L" and the anlog outputs are floating (Hi-Z). Figure 6 shows an example of the system timing at the power-down and power-up.
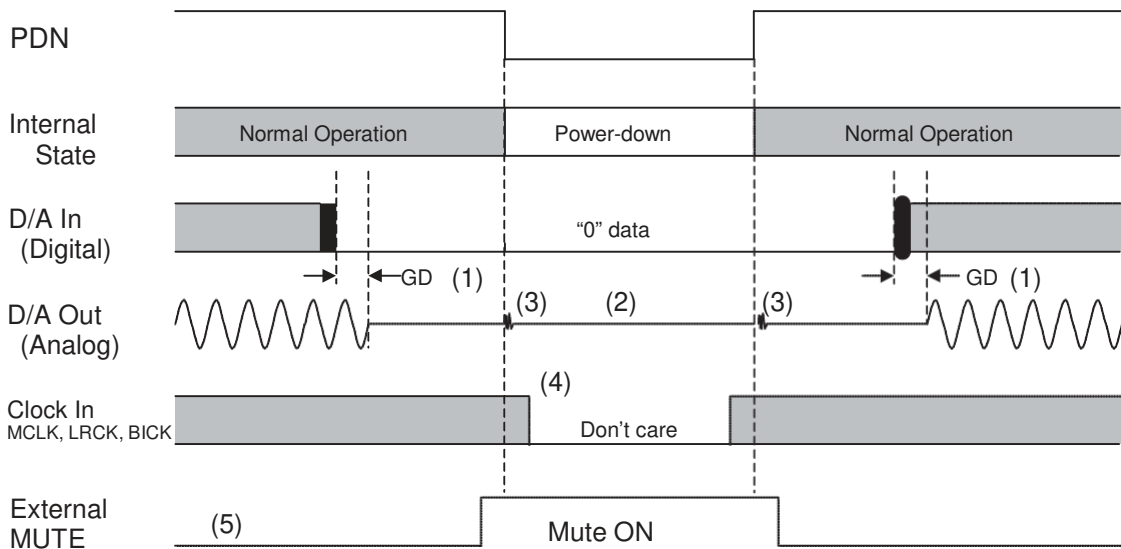

Notes:
    (1) The analog output corresponding to digital input has the group delay (GD).
    (2) Analog outputs are floating (Hi -Z) at the power-down mode.
    (3) Click noise occurs at the edge of PDN signal. This noise is output even if "0" data is input.
    (4) The external clocks (MCLK, BICK and LRCK) can be stopped in the power-down mode (PDN = "L").
    (5) Please mute the analog output externally if the click noise (3) influences system application.
       The timing example is shown in this figure.

Figure 6. Power-down/up sequence example

„ **Click Noise from analog output**

Click noise occurs from analog output in the following cases.
    1) When switching de-emphasis mode by DEM0, DEM1 and DFS pins,
    2) When switching serial data mode by DIF0, DIF1 and DIF2 pins,
    3) When going and exiting power down mode by PDN pin,
    4) When switching normal speed and double speed by DFS pin,
However in case of 1) & 2), If the input data is "0" or the soft mute is enabled (after 1024 LRCK cycles from SMUTE = "H"), no click noise occur except for switching DFS pin.

„ Mode Control Interface

Pins (parallel control mode) or registers (serial control mode) can control each functions of the AK4393. For DIF2-0, CKS2-0 and DFS, the setting of pin and register are "ORed" internally. So, even serial control mode, pin setting can also control these functions.

The serial control interface is enabled by the P/S pin = "L". In this mode, pin setting must be all "L". Internal registers may be written by 3-wire μP interface pins: CSN, CCLK and CDTI. The data on this interface consists of Chip address (2bits, C1/0; fixed to "01"), Read/Write (1bit; fixed to "1"), Register address (MSB first, 5bits) and Control data (MSB first, 8bits). The AK4393 latches the data on the rising edge of CCLK, so data should be clocked in on the falling edge. The writing of data becomes valid by CSN "n". The clock speed of CCLK is 5MHz(max). The CSN and CCLK must be fixed to "H" when the register does not be accessed.

PDN = "L" resets the registers to their default values. When the state of P/S pin is changed, the AK4393 should be reset by PDN = "L". In serial mode, the internal timing circuit is reset by RSTN bit, but the registers are not initialized.

C1-C0:   Chip Address (Fixed to "01")
R/W: READ/WRITE (Fixed to "1", Write only)
A4-A0:   Register Address
D7-D0:   Control Data

Figure 7. Control I/F Timing

*The AK4393 does not support the read command and chip address. C1/0 and R/W are fixed to "011"
*When the AK4393 is in the power down mode (PDN = "L") or the MCLK is not provided, writing into the control register is inhibited.
*For setting the registers, the following sequence is recommended.
    у Control 1 register
        (1) Writing RSTN = "0" and other bits (D6-D1) to the register at the same time.
        (2) Writing RSTN = "1" to the register. The other bits are no change.
    у Control 2 register
        This writing sequence has no limitation like control 1 register.
*When RSTN = "0", the click noise is output from AOUT pins.
*If the mode setting is done without setting RSTN = "0", large noise may be output from AOUT pins. (Especially when CKS0/1/2 are changed.)

,, **Register Map**

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
00H	Control 1	0	CKS2	CKS1	CKS0	DIF2	DIF1	DIF0	RSTN
01H	Control 2	0	0	0	0	DFS	DEM1	DEM0	SMUTE
02H	Test	TEST7	TEST6	TEST5	TEST4	TEST3	TEST2	TEST1	TEST0

Notes:

For addresses from 03H to 1FH, data must not be written.

When PDN pin goes to "L", the registers are initialized to their default values. When RSTN bit goes to "0", the only internal timing is reset and the registers are not initialized to their default values. DIF2-0, CKS2-0 and DFS bits are ORed with pins respectively.

DFS: Sampling speed control (see Table 1)
　　　0: Normal speed
　　　1: Double speed
　　　Register bit is ORed with DFS pin if P/S = "L".

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
02H	Test	TEST7	TEST6	TEST5	TEST4	TEST3	TEST2	TEST1	TEST0
	default	0	0	0	0	0	0	0	0

TEST7-0: Test mode. Do not write any data to 02H.

SYSTEM DESIGN

Figure 8 and 9 show the system connection diagram. An evaluation board (AKD4393) is available which demonstrates the optimum layout, power supply arrangements and measurement results.

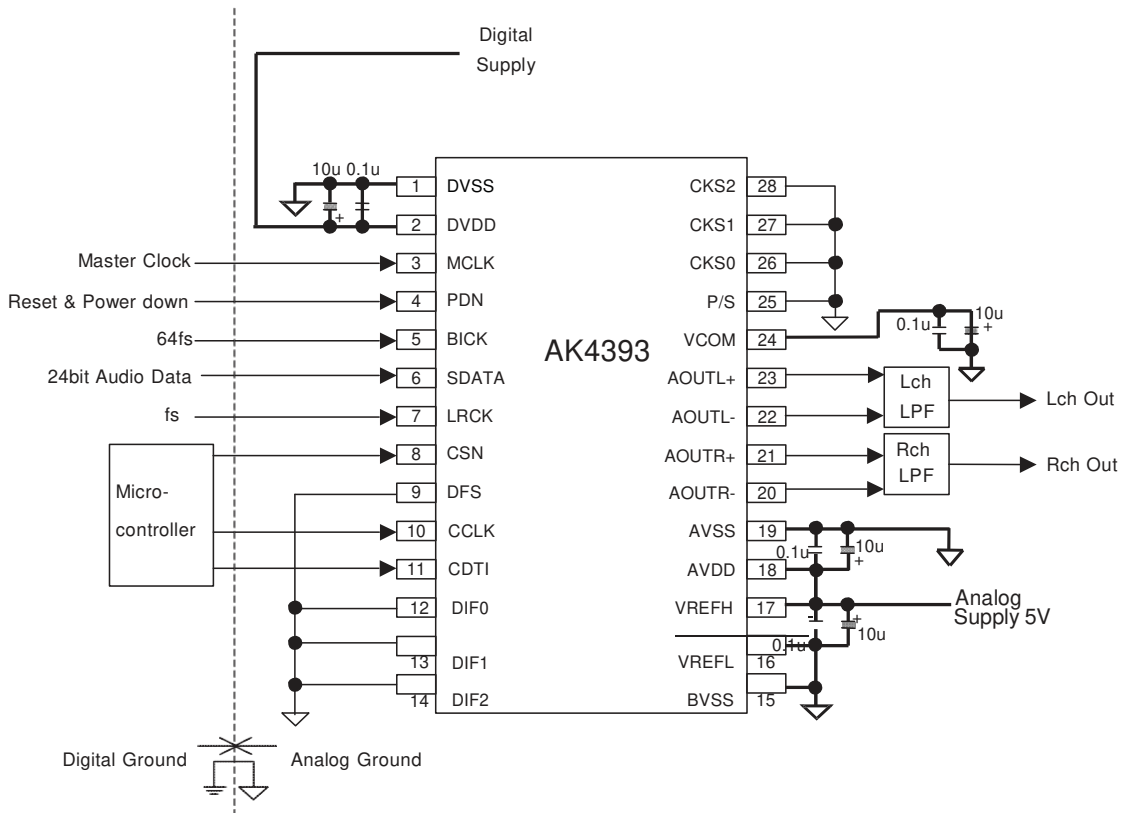

Figure 8. Typical Connection Diagram (Serial mode)

Notes:
- LRCK = fs, BICK = 64fs.
- Power lines of AVDD and DVDD should be distributed separately from the point with low impedance of regulator etc.
- AVSS, BVSS and DVSS must be connected to the same analog ground plane.
- When AOUT drives some capacitive load, some resistor should be added in series between AOUT and capacitive load.
- All input pins except pull-down/pull-up pins should not be left floating.

Figure 9. Typical Connection Diagram (Parallel mode)

Notes:
- LRCK = fs, BICK = 64fs.
- Power lines of AVDD and DVDD should be distributed separately from the point with low impedance of regulator etc.
- AVSS, BVSS and DVSS must be connected to the same analog ground plane.
- When AOUT drives some capacitive load, some resistor should be added in series between AOUT and capacitive load.
- All input pins except pull-down/pull-up pins should not be left floating.
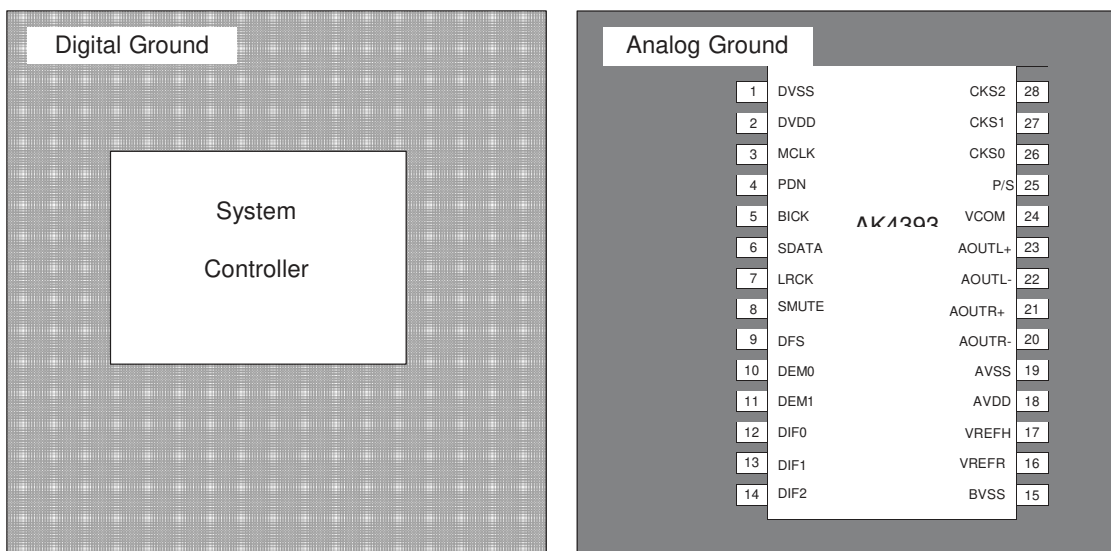

Figure 10. Ground Layout

1. Grounding and Power Supply Decoupling

To minimize coupling by digital noise, decoupling capacitors should be connected to AVDD and DVDD, respectively. AVDD is supplied from analog supply in system and DVDD is supplied from digital supply in system. If AVDD and DVDD are supplied separately, the power up sequence is not critical. **AVSS, BVSS and DVSS must be connected to analog ground plane.** System analog ground and digital ground should be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors for high frequency should be placed as near as possible.

2. Voltage Reference

The differential Voltage between VREFH and VREFL set the analog output range. VREFH pin is normally connected to AVDD and VREFL pin is normally connected to AVSS. VREFH and VREFL should be connected with a 0.1μF ceramic capacitor. VCOM is a signal ground of this chip. An electrolytic capacitor 10μF parallel with a 0.1μF ceramic capacitor attached to VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from VCOM pin. All signals, especially clocks, should be kept away from the VREFH, VREFL and VCOM pins in order to avoid unwanted coupling into the AK4393.

3. Analog Outputs

The analog outputs are full differential outputs and 2.4Vpp (typ@VREF=5V) centered around VCOM. The differential outputs are summed externally, V_{AOUT} = (AOUT+) - (AOUT-) between AOUT+ and AOUT-. If the summing gain is 1, the output range is 4.8Vpp (typ@VREF=5V). The bias voltage of the external summing circuit is supplied externally. The input data format is 2's complement. The output voltage (V_{AOUT}) is a positive full scale for 7FFFFFH (@24bit) and a negative full scale for 800000H (@24bit). The ideal V_{AOUT} is 0V for 000000H(@24bit).

The internal switched-capacitor filters attenuate the noise generated by the delta-sigma modulator beyond the audio passband.

Figure 11 shows an example of external LPF circuit summing the differential outputs by an op-amp.
Figure 12 shows an example of differential outputs and LPF circuit example by three op-amps.

———— IMPORTANT NOTICE ————

z These products and their specifications are subject to change without notice.
When you consider any use or application of these products, please make inquiries the sales office of Asahi Kasei Microdevices Corporation (AKM) or authorized distributors as to current status of the products.

z Descriptions of external circuits, application circuits, software and other related information contained in this document are provided only to illustrate the operation and application examples of the semiconductor products. You are fully responsible for the incorporation of these external circuits, application circuits, software and other related information in the design of your equipments. AKM assumes no responsibility for any losses incurred by you or third parties arising from the use of these information herein. AKM assumes no liability for infringement of any patent, intellectual property, or other rights in the application or use of such information contained herein.

z Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.

z AKM products are neither intended nor authorized for use as critical components$_{Note1)}$ in any safety, life support, or other hazard related device or system$_{Note2)}$, and AKM assumes no responsibility for such use, except for the use approved with the express written consent by Representative Director of AKM. As used here:

Note1) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.

Note2) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.

z It is the responsibility of the buyer or distributor of AKM products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.

</div>

Appendix A

In Double Speed Mode, the phase relationship between MCLK and LRCK/BICK is limited (Table 7). If the phase relationship happens during this prohibited period, it is possible to occur the inverse of output channel. The phase relationship must be set to avoid the prohibited period when the AK4393 operates at Double Speed Mode. The prohibited period is specified by the combination of digital power supply voltage (DVDD), MCLK frequency and audio data format (Table 5). When the audio data formats are 16/20/24bit LSB Justified (Mode 0,1,4) and 24bit MSB Justified (Mode 2), the phase relationship (tLRM: Figure 11) between the rising edge of LRCK and the rising edge of MCLK has the prohibited period of min to max in Table 7. In case of I^2S Compatible (Mode 3), the relationship between the falling edge of BICK and the rising edge of MCLK has the prohibited period (tBCM: Figure 12)

| Sampling Mode	Digital Power Supply, DVDD	MCLK Frequency	Mode Setting				Prohibited Period		Units
			CKS2	CKS1	CKS0	DFS	min	max	
Double Speed	3.0 to 5.25V	128fs	0	0	0	1	0.4	1.7	ns
