

CY62137VN MoBL[®]

2-Mbit (128K x 16) Static RAM

Features

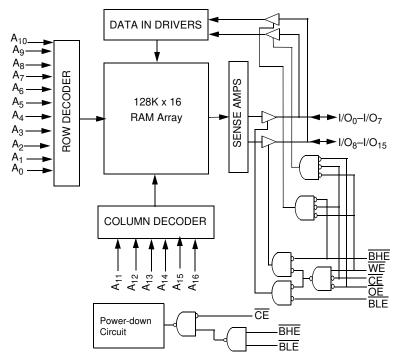

- Temperature Ranges
 - Industrial: –40°C to 85°C
 - Automotive-A: –40°C to 85°C
 - Automotive-E: –40°C to 125°C
- High Speed: 55 ns
- Wide voltage range: 2.7V–3.6V
- Ultra-low active, standby power
- · Easy memory expansion with CE and OE features
- · TTL-compatible inputs and outputs
- Automatic power-down when deselected
- · CMOS for optimum speed/power
- Available in Pb-free 44-pin TSOP Type II package

Functional Description^[1]

The CY62137VN is a high-performance CMOS static RAM organized as 128K words by 16 bits. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life[™] (MoBL[®]) in

portable applications such as cellular telephones. The device also has an automatic power-down feature that reduces power consumption by 99% when addresses are not toggling. The device can also be put into standby mode when deselected (CE HIGH) or when CE is LOW and both BLE and BHE are HIGH. The input/output pins (I/O₀ through I/O_{15}) are placed in a high-impedance state when: deselected (CE HIGH), outputs are disabled (OE HIGH), BHE and BLE are disabled (BHE, BLE HIGH), or during a write operation (CE LOW, and WE LOW).Writing to the device is accomplished by taking Chip Enable (CE) and Write Enable (WE) inputs LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O0 through I/O7), is written into the location specified on the address pins (A₀ through A₁₆). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A0 through A16).Reading from the device is accomplished by taking Chip Enable (CE) and Output Enable (OE) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7 . If Byte High Enable (BHE) is LOW, then data from memory will appear on I/O8 to I/O15. See the truth table at the back of this data sheet for a complete description of read and write modes.

Pin Definitions

Pin Number	Туре	Description
1–5, 18–22, 24–27, 42–45	Input	A ₀ -A ₁₆ . Address Inputs
7–10, 13–16, 29–32, 35–38	Input/Output	I/O0-I/O15. Data lines. Used as input or output lines depending on operation
23	No Connect	NC. This pin is not connected to the die
17	Input/Control	$\overline{\textbf{WE}}.$ When selected LOW, a WRITE is conducted. When selected HIGH, a READ is conducted
6	Input/Control	CE. When LOW, selects the chip. When HIGH, deselects the chip
40, 39	Input/Control	Byte Write Select Inputs, active LOW. $\overline{\text{BHE}}$ controls I/O ₁₅ –I/O ₈ , $\overline{\text{BLE}}$ controls I/O ₇ –I/O ₀ .
41	Input/Control	OE . Output Enable. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tri-stated, and act as input data pins
12, 34	Ground	V _{SS} . Ground for the device
11, 33	Power Supply	V _{CC} . Power supply for the device

Notes: 2. NC pins are not connected on the die. 3. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(TYP)}., T_A = 25°C.

CY62137VN MoBL®

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature65°C to +150°C
Ambient Temperature with Power Applied55°C to +125°C
Supply Voltage to Ground Potential0.5V to +4.6V
DC Voltage Applied to Outputs in High-Z State $^{[4]}$ 0.5V to V_{CC} + 0.5V
DC Input Voltage ^[4] 0.5V to V _{CC} + 0.5V

Output Current into Outputs (LOW)	20 mA
Static Discharge Voltage (per MIL-STD-883, Method 3015)	> 2001V

Latch-up Current.....> 200 mA

Operating Range

t _{BW}	BHE / BLE LOW to End of Write	50		60		ns

Notes:

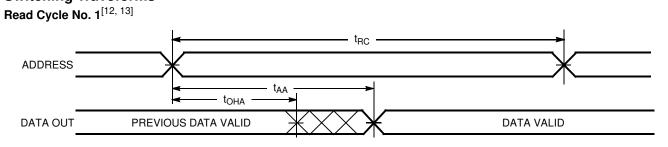

6. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input levels of 0 to V_{CC} typ., and output loading of the specified I_{OL}/I_{OH} and 30 pF load capacitance. 7. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device. 8. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in (b) of AC Test Loads. Transition is measured ±500 mV from steady-state voltage. 9. If both byte enables are toggled together this value is 10 ns.

10. The internal write time of the memory is defined by the overlap of CE LOW and WE LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
11. The minimum write cycle time for write cycle #3 (WE controlled, OE LOW) is the sum of t_{HZWE} and t_{SD}.

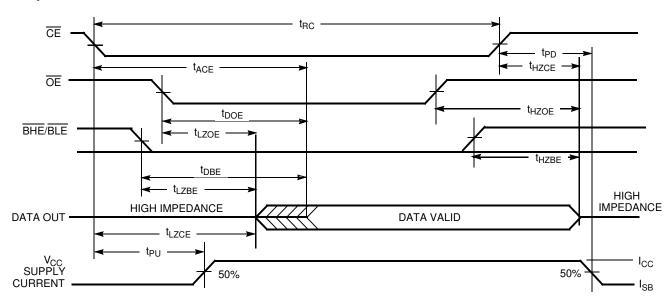

CY62137VN MoBL[®]

Switching Waveforms

Read Cycle No. 2^[13, 14]

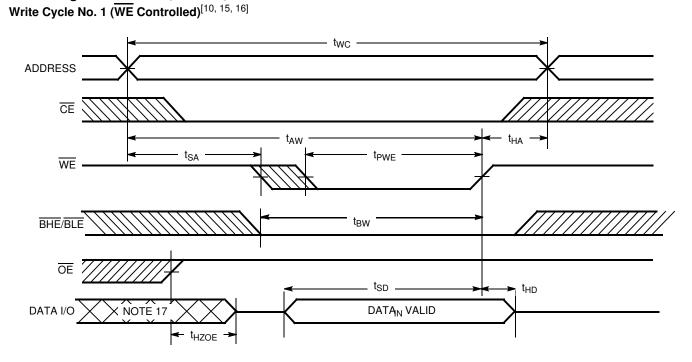

Notes:

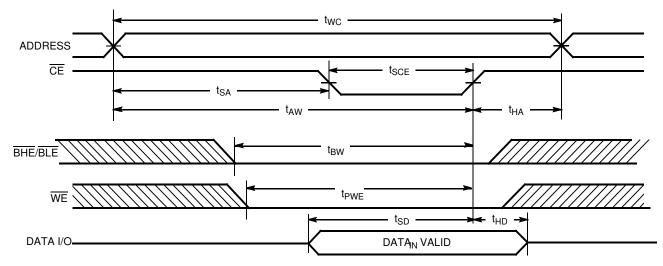

12. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$. 13. WE is HIGH for read cycle. 14. Address valid prior to or coincident with \overline{CE} transition LOW.

Switching Waveforms (continued)

Write Cycle No. 2 (CE Controlled)^[10, 15, 16]

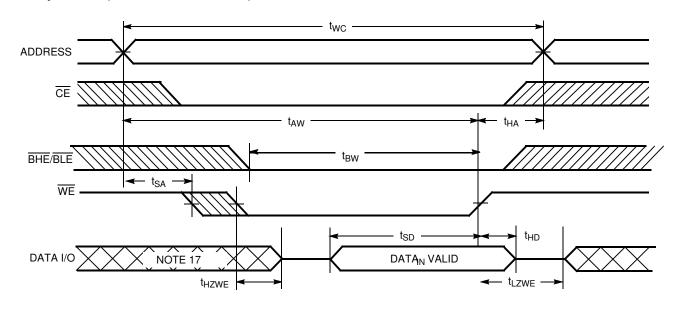

Notes:

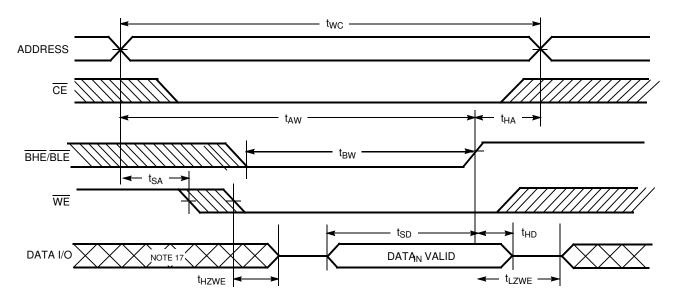

15. Data I/O is high-impedance if OE = V_{IH}.
16. If CE goes HIGH simultaneously with WE HIGH, the output remains in a high-impedance state.
17. During this period, the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued) Write Cycle No. 3 (WE Controlled, OE LOW)^[11, 16]

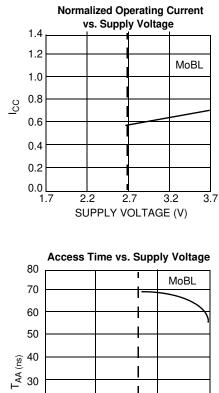

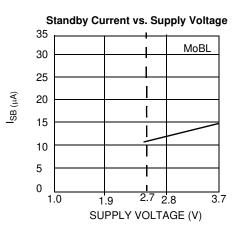

Write Cycle No. 4 (BHE/BLE Controlled, OE LOW)^[17]
