Specifications Overview:

- **CompactFlash Association Specification Revision 6.1 Standard Interface**
 - ATA command set compatible
 - ATA transfer mode supports: PIO Mode 6, Multiword DMA Mode 4, Ultra DMA Mode 6 in True-IDE mode
- **Capacity**
 - 8, 16, 32, 64, 128 GB
- **Performance***
 - Sequential read: Up to 90 MB/sec
 - Sequential write: Up to 55 MB/sec
 - Random read (4K): Up to 2,000 IOPS
 - Random write (4K): Up to 1,000 IOPS
- **Flash Management**
 - Global Wear Leveling
 - Built-in BCH ECC capable of correcting up to 96 bits in 1KB data
 - Supports S.M.A.R.T commands
 - Flash Block Management
 - Flash Translation Layer: Page Mapping
 - Power Failure Management
- **Reliability**
 - Supply voltage power-down detection for full power-down robustness
- **NAND Flash Type: MLC**
- **MTBF: >1,000,000 hours**
- **Endurance (in Terabytes Written: TBW)**
 - 8 GB: 3 TBW
 - 16 GB: 8 TBW
 - 32 GB: 15 TBW
 - 64 GB: 24 TBW
 - 128 GB: 58 TBW
- **Temperature Range**
 - Operating:
 - Standard: 0°C to 70°C
 - Wide: -40°C to 85°C
 - Storage: -40°C to 100°C
- **Supply Voltage**
 - 3.3V ± 5%
 - 5.0V ± 10%
- **Power Consumption***
 - Operating Voltage: 3.3V
 - Active mode: 165 mA
 - Standby mode: 10 mA
 - Operating Voltage: 5.0V
 - Active mode: 170 mA
 - Standby mode: 10 mA
- **Connector Type**
 - 50 pins female
- **Form Factor**
 - 36.4mm x 42.8mm x 3.3mm
 - Net Weight: 9.82 g
- **Halogen Free**
- **RoHS Recast Compliant**
 - Complies with 2011/65/EU Standard

*Varies from capacities. The values for performances and power consumptions presented are typical and may vary depending on flash configurations or platform settings.

1. General Descriptions

Apacer's value-added Industrial CompactFlash Card offers high performance, high reliability and power-efficient storage. Regarding standard compliance, this CompactFlash Card complies with CompactFlash specification revision 6.1, supporting transfer modes up to Programmed Input Output (PIO) Mode 6, Multi-word Direct Memory Access (DMA) Mode 4, Ultra DMA Mode 6 in True-IDE Mode.

Apacer's value-added CFC provides complete PCMCIA – ATA functionality and compatibility. Apacer's CompactFlash technology is designed for applications in Point of Sale (POS) terminals, telecom, IP-STB, medical instruments, surveillance systems, industrial PCs and handheld applications such as the new generation of Digital Single Lens Reflex (DSLR) cameras.

1.1 Intelligent Endurance Design

1.1.1 Error Correction Code (ECC)

The CompactFlash card is programmed with BCH Error Detection Code (EDC) and Error Correction Code (ECC) algorithms capable of correcting up to 96 random bits in 1KB bytes data.

High performance is achieved through hardware-based error detection and correction.

1.1.2 Global Wear Leveling

Flash memory devices differ from Hard Disk Drives (HDDs) in terms of how blocks are utilized. For HDDs, when a change is made to stored data, like erase or update, the controller mechanism on HDDs will perform overwrites on blocks. Unlike HDDs, flash blocks cannot be overwritten and each P/E cycle wears down the lifespan of blocks gradually. Repeatedly program/erase cycles performed on the same memory cells will eventually cause some blocks to age faster than others. This would bring flash storages to their end of service term sooner. Global Wear leveling is an important mechanism that levels out the wearing of blocks so that the wearing-down of all blocks can be almost evenly distributed. This will increase the lifespan of SSDs.

1.1.3 S.M.A.R.T. Technology

S.M.A.R.T. is an acronym for Self-Monitoring, Analysis and Reporting Technology, an open standard allowing disk drives to automatically monitor their own health and report potential problems. It protects the user from unscheduled downtime by monitoring and storing critical drive performance and calibration parameters. Ideally, this should allow taking proactive actions to prevent impending drive failure. Apacer SMART feature adopts the standard SMART command B0h to read data from the drive. When the Apacer SMART Utility running on the host, it analyzes and reports the disk status to the host before the device is in critical condition.

Code	SMART Subcommand
D0h	READ DATA
D1h	READ ATTRIBUTE THRESHOLDS
D2h	Enable/Disable Attribute Autosave
D4h	Execute Off-line Immediate
D5h	Read Log (optional)
D6h	Write Log (optional)
D8h	Enable Operations

D9h	Disable operations
DAh	Return Status

General SMART attribute structure

Byte	Description
0	ID (Hex)
1 – 2	Status flag
3	Value
4	Worst
5*-11	Raw Data

*Byte 5: LSB

SMART attribute ID list

ID (Hex)	Attribute Name
12 (0x0C)	Power cycle count
160 (0xA0)	Initial bad block count
161 (0xA1)	Bad block count
162 (0xA2)	Spare block count
163 (0xA3)	Max. erase count
164 (0xA4)	Avg. erase count
241 (0xF1)	Total LBAs written
242 (0xF2)	Total LBAs read

1.1.4 Flash Block Management

Current production technology is unable to guarantee total reliability of NAND flash memory array. When a flash memory device leaves factory, it comes with a minimal number of initial bad blocks during production or out-of-factory as there is no currently known technology that produce flash chips free of bad blocks. In addition, bad blocks may develop during program/erase cycles. When host performs program/erase command on a block, bad block may appear in Status Register. Since bad blocks are inevitable, the solution is to keep them in control. Apacer flash devices are programmed with ECC, block mapping technique and S.M.A.R.T to reduce invalidity or error. Once bad blocks are detected, data in those blocks will be transferred to free blocks and error will be corrected by designated algorithms.

1.1.5 Flash Translation Layer – Page Mapping

Page mapping is an advanced flash management technology whose essence lies in the ability to gather data, distribute the data into flash pages automatically, and then schedule the data to be evenly written. Page-level mapping uses one page as the unit of mapping. The most important characteristic is that each logical page can be mapped to any physical page on the flash memory device. This mapping algorithm allows different sizes of data to be written to a block as if the data is written to a data pool and it does not need to take extra operations to process a write command. Thus, page mapping is adopted to increase random access speed and improve SSD lifespan, reduce block erase frequency, and achieve optimized performance and lifespan.

1.1.6 Power Failure Management

Power Failure Management plays a crucial role when power supply becomes unstable. Power disruption may occur when users are storing data into the SSD, leading to instability in the drive. However, with Power Failure Management, a firmware protection mechanism will be activated to scan pages and blocks once power is resumed. Valid data will be transferred to new blocks for merging and the mapping table will be rebuilt. Therefore, data reliability can be reinforced, preventing damage to data stored in the NAND Flash.

2. Functional Block

The CompactFlash Card (CFC) includes a controller and flash media, as well as the CompactFlash standard interface. Figure 2-1 shows the functional block diagram.

Figure 2-1 Functional Block Diagram

3. Pin Assignments

Table 3-1 lists the pin assignments with respective signal names for the 50-pin configuration. A “#” suffix indicates the active low signal. The pin type can be input, output or input/output.

Table 3-1 Pin Assignments

4. Product Specifications

4.1 Capacity

Capacity specifications of the Compact Flash Card series (CFC) are available as shown in Table 4-1. It lists the specific capacity and the default numbers of heads, sectors and cylinders for each product line.

Table 4-1 Capacity Specifications

Capacity	Total bytes*	Cylinders	Heads	Sectors	Max LBA
8 GB	8,012,390,400	15,525	16	63	15,649,200
16 GB	16,013,942,784	16,383	16	63	31,277,232
32 GB	32,017,047,552	16,383	16	61	62,533,296
64 GB	64,023,257,088	65,535	16	63	125,045,424
128 GB	128,035,676,160	65,535	16	63	250,069,680

Note:

Display of total bytes varies from operating systems.

Cylinders, heads or sectors are not applicable for these capacities. Only LBA addressing applies.

Notes: 1 GB = 1,000,000,000 bytes; 1 sector = 512 bytes.

LBA count addressed in the table above indicates total user storage capacity and will remain the same throughout the lifespan of the device. However, the total usable capacity of the SSD is most likely to be less than the total physical capacity because a small portion of the capacity is reserved for device maintenance usages.

4.2 Performance

Performance of the CF cards is listed in Table 4-2.

Table 4-2 Performance Specifications

Performance	Capacity				
	8 GB	16 GB	32 GB	64 GB	128 GB
Sequential Read* (MB/s)	50	85	80	85	90
Sequential Write* (MB/s)	21	36	38	55	55
Random Read IOPS** (4K)	2,000	2,000	2,000	2,000	2,000
Random Write IOPS** (4K)	800	1,000	1,000	1,000	1,000

Note:

Results may differ from various flash configurations or host system setting.

*Sequential performance is based on CrystalDiskMark 5.2.1 with file size 1,000MB.

**Random performance measured using IOMeter with Queue Depth 32.

4.3 Environmental Specifications

Environmental specifications of the Compact Flash Card series (CFC) are shown in Table 4-3.

Table 4-3 Environmental Specifications

Item	Specifications
Operating temp.	0°C to 70°C (Standard); -40°C to 85°C (Wide)
Non-operating temp.	-40°C to 100°C
Operating vibration	7.69 GRMS, 20~2000 Hz/random (compliant with MIL-STD-810G)
Non-operating vibration	4.02 GRMS, 15 ~ 2000 Hz/sine (compliant with MIL-STD-810G)
Operating shock	50G, 11ms, half-sine wave
Non-operating shock	1,500G, 0.5ms, half-sine wave

4.4 Mean Time Between Failures (MTBF)

MTBF, an acronym for Mean Time Between Failures, is a measure of a device’s reliability. Its value represents the average time between a repair and the next failure. The measure is typically in units of hours. The higher the MTBF value, the higher the reliability of the device. The predicted result of this CompactFlash Card is higher than 1,000,000 hours.

4.5 Certification and Compliance

The CompactFlash card complies with the following global standards:

- CE
- FCC
- Halogen-free
- EMC
- RoHS Recast (2011/65/EU)

4.6 Endurance

The endurance of a storage device is predicted by TeraBytes Written based on several factors related to usage, such as the amount of data written into the drive, block management conditions, and daily workload for the drive. Thus, key factors, such as Write Amplifications and the number of P/E cycles, can influence the lifespan of the drive.

Table 4-4 Endurance Specifications

Capacity	TeraBytes Written
8 GB	3
16 GB	8
32 GB	15
64 GB	24
128 GB	58

Note:

- This estimation complies with JEDEC JESD-219, enterprise endurance workload of sequential data with payload size distribution.
- Flash vendor guaranteed MLC P/E cycle: 3K
- WAF may vary from capacity, flash configurations and writing behavior on each platform.
- 1 Terabyte = 1,024 GB

5. Software Interface

● **Supply Voltage Monitor Parameters**

Symbol	Parameter	Min	Typ	Max	Unit	Remark
Res _{1.2R}	1.2V Reset rising threshold		95		%	of 1.2V regulator output
Res _{3.3R}	3.3V Reset rising threshold	2.23	2.35	2.47	V	at VCC pin
Res _{3.3F}	3.3V Reset falling threshold	2.15	2.20	2.25	V	at VCC pin
S _{5VH}	5V sense high threshold	4.31	4.40	4.49	V	at SENSE5V pin
S _{5VL}	5V sense low threshold	3.01	3.07	3.13	V	at SENSE5V pin
S _{3V}	3.3V sense threshold	2.84	2.90	2.96	V	at SENSE3V pin

The Res_{1.2R} and Res_{3.3R} thresholds are used by the reset logic to release the internal reset signal on a system power-on. The Res_{3.3L} threshold is used to assert the internal reset signal on a system power down.

The S_{3V} and S_{5V} threshold comparators generate interrupts to the firmware. The S_{3V} comparator normally monitors the 3.3V VCC supply, the S_{5V} comparator normally monitors the 5V or 3.3V module supply. The S_{3V} interrupt can be used to stop accesses to the flash memory early on a system power down event. The S_{5V} interrupt can be used to implement a supply hold-up functionality when a backup energy source is available.

In packages that do not have the SENSE3V pin, SENSE3V is internally connected to VCC.

6.3.2 AC Characteristics

The AC Characteristics reference the timing diagrams of the CompactFlash Specification Revision 4.1 and the symbols in these timing diagrams. The AC characteristics are valid for a supply voltage of 3.3V ± 5%.

- **True-IDE UDMA Mode Read and Write Characteristics**

The interface timing in the True-IDE UDMA modes is not only depending on the interface hardware, but also on the correct setup of the UDMA registers in the firmware, according to the UDMA transfer mode selected by the host. With a correct register setup, the interface timing complies to the UDMA Mode 0 to Mode 7 timing specifications of the CF Specification Revision 6.1, and to the UDMA Mode 0 to Mode 6 timing specifications of the ATA/ATAPI-7 Standard.

- **Toggle Mode Flash Memory Interface Characteristics**

The AC Characteristics for the flash memory interface are based on the F9 flash interface clock cycle time. τ is $\frac{1}{2}$ of the flash interface clock cycle time configured in the preformat. In Toggle mode, the valid range for τ is 5ns to 10ns. The table lists the flash memory interface timing based on τ , valid for a load of not more than 45pF on the flash interfacepins.

Symbol	Parameter	Min	Typ	Max	Unit
t _{CALS}	CLE, ALE setup time	6 τ - 2			ns
t _{CALH}	CLE, ALE hold time	1.5 τ - 2			ns

t _{QH}	Input data hold from DQS	0.5 τ + 0.8			ns

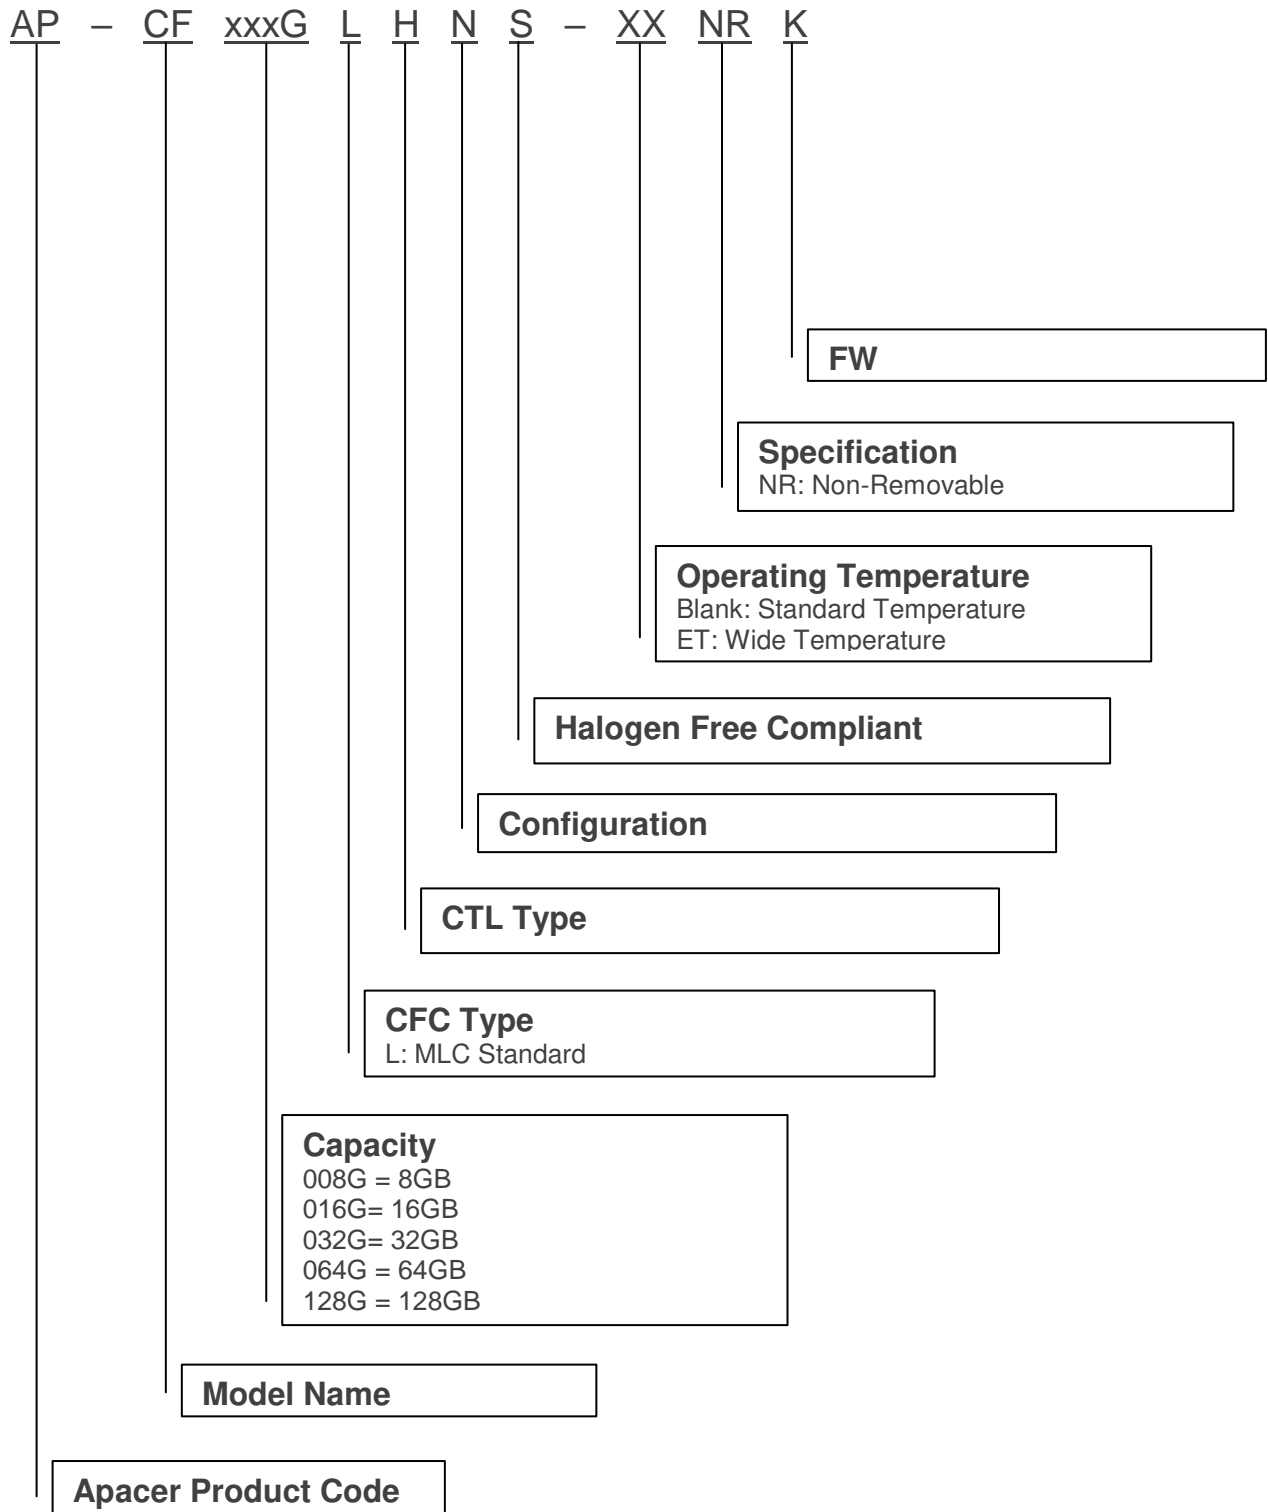

● **ONFI-2 Mode Flash Memory Interface Characteristics**

The AC Characteristics for the flash memory interface are based on the F9 flash interface clock cycle time. τ is ½ of the flash interface clock cycle time configured in the preformat. In ONFI-2 mode, the valid range for τ is 5ns to 10ns. The table lists the flash memory binterface timing based on τ, valid for a load of not more than 45pF on the flash interface pins.

Symbol	Parameter	Min	Typ	Max	Unit
t _{CK}	Average clock cycle time		2 τ		ns
t _{CKH}	Clock high time	0.94 τ		1.06 τ	ns
