

## Demonstration board for PWD5F60 smart driver with integrated high voltage full bridge

Data brief

### Features

- Power system-in-package integrating gate drivers and power MOSFETs featuring:
  - $R_{DS(ON)} = 1.38 \Omega$
  - $BV_{DSS} = 600 \text{ V}$
  - 2 embedded comparators
- Very low area occupation, all active devices in SMT technology and no heatsink
- Fast-decay or slow-decay on-board constant OFF-time peak current control
- PWM voltage mode control with overcurrent protection possible via external logic signals
- Driver supply voltage range: 10 V to 20 V
- UVLO protection on low-side and high-side
- 3.3 V to 15 V compatible inputs with hysteresis and pull-down
- Internal bootstrap diode
- Bill of materials reduction
- Very compact and simplified layout
- Flexible, easy and fast design
- RoHS compliant
- Load current up to 1 A

### Description

The PWD5F60 is an advanced power system-in-package integrating gate drivers and four N-channel power MOSFETs in a compact QFN package.

The integrated power MOSFETs have an  $R_{DS(ON)}$  of  $1.38 \Omega$  and 600 V drain-source breakdown voltage. The embedded gate drivers feature two comparators that can be used for peak current control or overcurrent protection and integrate bootstrap diodes. This allows to effectively drive loads in a tiny space and to drastically reduce external components and bill of materials.

The EVALPWD5F60 demonstrates how to use the PWD5F60 to drive a single-phase load in full-bridge topology. This allows control of both the direction and the value of the current flowing into the load. Typical applications that can benefit from the high integration of the PWD5F60 are, for example, single-phase BLDC motors and fans.

The board has a very small footprint and an optimized layout thanks to the integrated features of the PWD5F60, and it can be simply run by applying the supply voltages and a direction signal.

The board allows easy selection and modification of the relevant external component values, enabling fast performance evaluation under different applicative conditions as well as fine tuning of final application components.

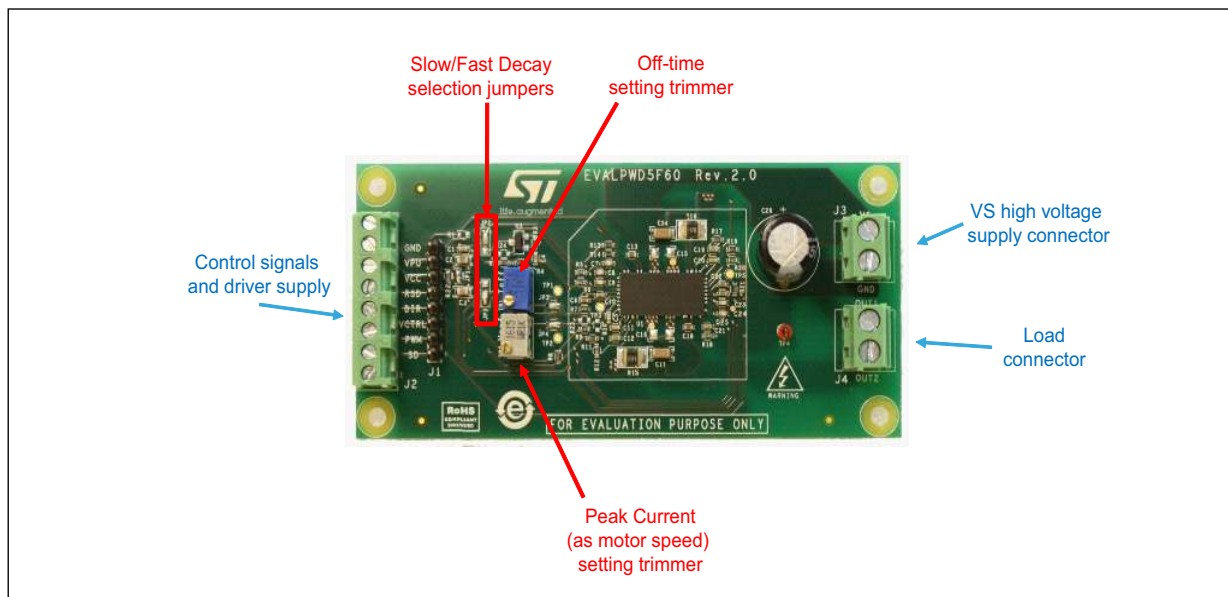

# 1 Board description

**Table 1. EVKLPWD5F60 electrical specifications**

Parameter	Value
Max supply voltage range (VS) <sup>(1)</sup>	400 V <sub>DC</sub>
Driver supply voltage (Vcc)	10 to 20 V
Logic control signals	0 to 15 V
Junction to ambient thermal resistance RJA <sup>(2)</sup>	30 °C/W
Operating temperature range	-40 °C to +125 °C

1. Maximum VS voltage is limited by the electrolytic bulk capacitor (C26) voltage rating; PWD5F60 BVDSS is 600 V.
2. Measured with uniform dissipation on the power MOSFETs

**Figure 1. Jumpers and connectors location**

**Table 2. Jumpers and connectors description**

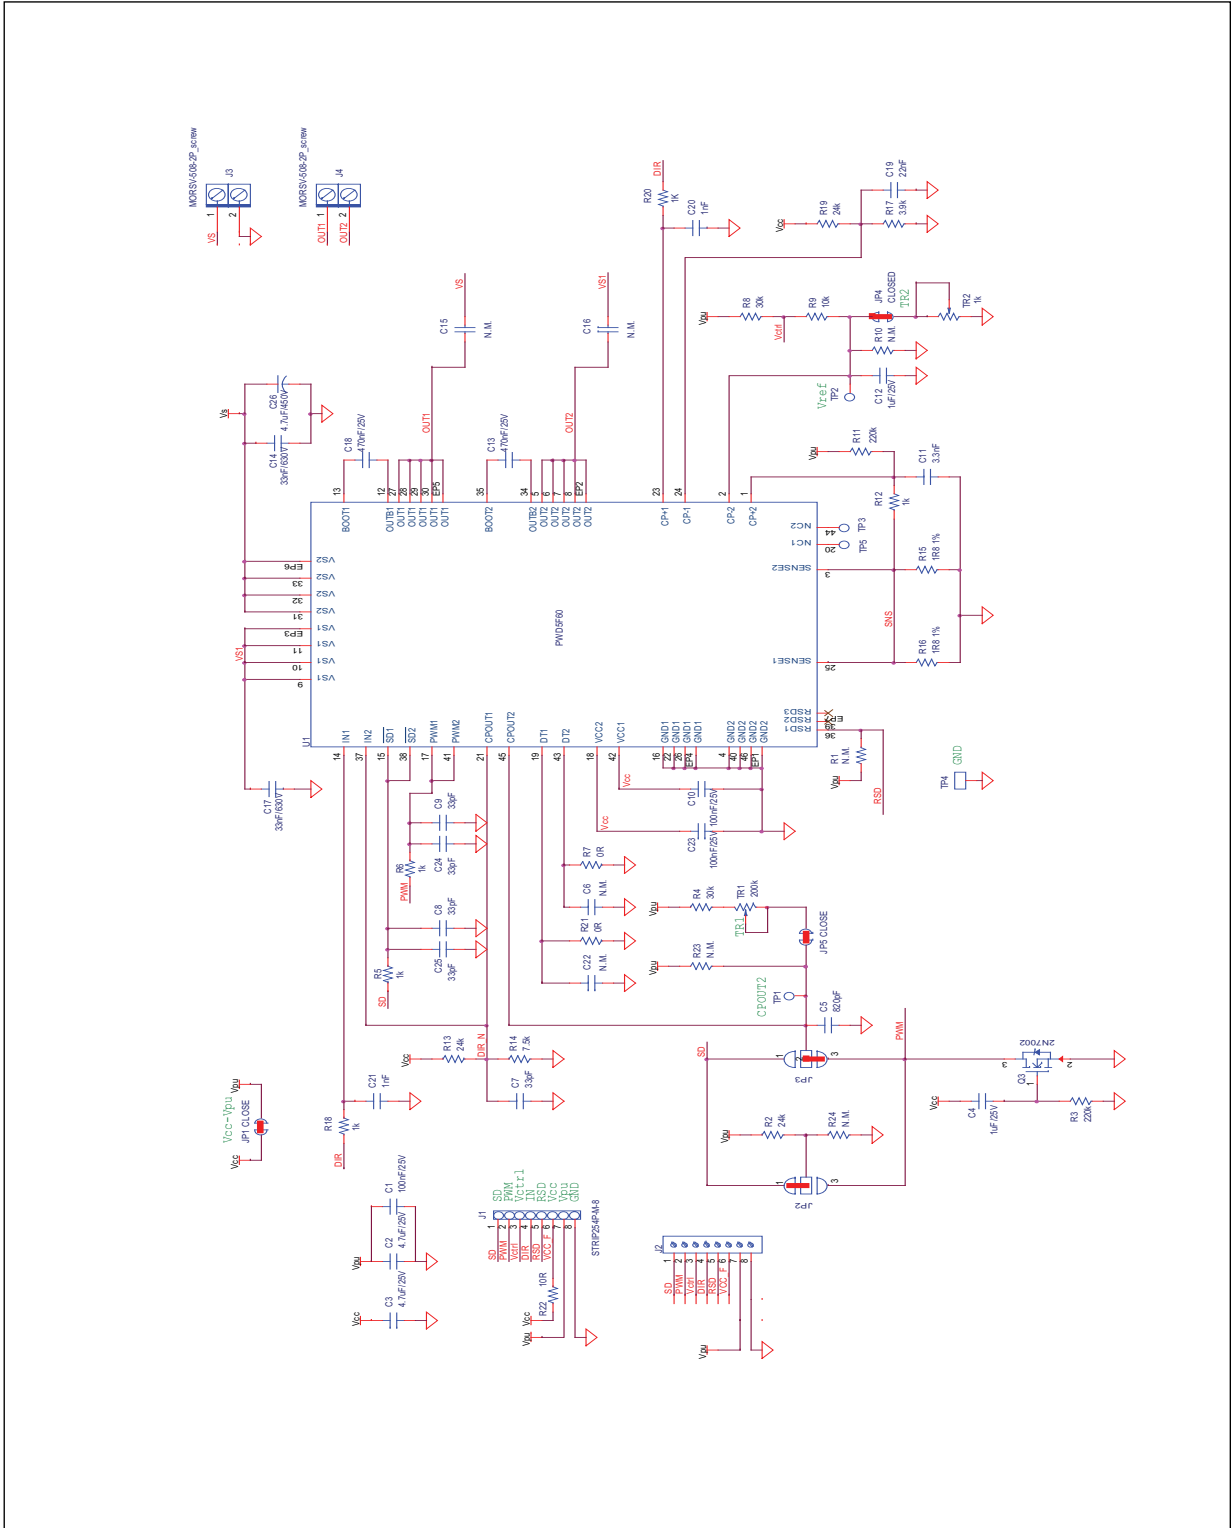

Name	Type	Function
J1	Control signals connector	VCC and logic control signals, pin strip header
J2	Control signals connector	VCC and logic control signals, terminal block connector
J3	Power supply	VS high voltage power supply connector
J4	Power output	Load connector
JP1	Configuration jumper	To connect $V_{PU}$ pull-up voltage to VCC
JP2	Configuration jumper	To pull-up SD or PWM signals to $V_{PU}$ pull-up voltage
JP3	Configuration jumper	To connect SD or PWM signal to CPOUT2
JP4	Configuration jumper	To use trimmer TR2 for setting the peak current instead of R10
JP5	Configuration jumper	To use trimmer TR1 for setting OFF-time duration after overcurrent detection instead of R23

**Table 3. Control signals connector pinout (J1 - J2)**

Pin	Label	Type	Description
1	SD	Digital input	Drivers' SD signal
2	PWM	Digital input	Drivers' PWM signal
3	VCTRL	Analog / PWM input	$V_{ctrl}$ signal, sets current limit threshold (as motor speed)
4	DIR	Digital input	DIR signal, sets current's direction (as from Hall sensor)
5	RSD	Reserved	Reserved
6	VCC	Power supply	Drivers' $V_{CC}$ power supply
7	VPU	Power supply	$V_{PU}$ pull-up voltage for drivers' signals. Close JP1 to connect to VCC
8	GND	Power supply	GND
