## ILB IB 24 DO16-DSUB

INTERBUS

Inline Block IO Module for INTERBUS With 16 Digital Outputs; Bus Connection via D-SUB Connectors

#### **AUTOMATIONWORX**

Data Sheet 7119\_en\_02

© PHOENIX CONTACT - 03/2007

#### Description

The ILB IB 24 DO16-DSUB module is designed for use within an INTERBUS network. It is used to output digital signals.

#### **INTERBUS** Features

- Remote bus connection via D-SUB connector
- 500 kbps transmission speed
- Diagnostic and status indicators

#### **Output Features**

- Connections for 16 digital actuators
- Connection of actuators in 2 and 3-wire technology
- Nominal current per output: 0.5 A
- Total current of all outputs: 8 A
- Short-circuit and overload protected outputs
- Diagnostic and status indicators

Please refer to the "Mounting and Removing Inline Block IO Modules" application note (see "Ordering Data" on page 2).

Make sure you always use the latest documentation. It can be downloaded at <u>www.download.phoenixcontact.com</u>.

A conversion table is available on the Internet at <u>www.download.phoenixcontact.com/general/7000\_en\_00.pdf</u>.

|                | tuator supply 1 (connector 5<br>d connector 6 for actuators)                             |
|                | tuator supply 2 (connector 7<br>d connector 8 for actuators)                             |
|                |                                                                                          |
|                | ort circuit or overload at one the outputs                                               |
| w Sta          | atus indicators of the outputs                                                           |
|                | an<br>Ac<br>an<br>d Sh<br>of                                                             |

If the error LED (E) of a group of eight outputs lights up (e.g., connector 5 and connector 6), this indicates that a short circuit or overload is present at one or more of the outputs in this group.

# Connecting INTERBUS, the Supply, and Actuators

Figure 4 Terminal point assignment of the connectors

Terminal Point Assignment of the MINI COMBICON Connectors for the Connection of the Supply Voltages (Connectors X1 and X2 in Figure 4 on page 8)

| Terminal<br>Point | Assignment                               |
|-------------------|------------------------------------------|
| UL                | 24 V communications power U <sub>L</sub> |
| UA1               | 24 V actuator supply U <sub>A1</sub>     |
| UA2               | 24 V actuator supply U <sub>A2</sub>     |
| NC                | Not used                                 |

| Terminal<br>Point | Assignment              |
|-------------------|-------------------------|
| 0V                | GND                     |
| 0V                | GND                     |
| 0V                | GND                     |
| NC                | Not used                |
| FE                | Functional earth ground |

 $\triangle$ 

The terminal points for GND (0V) can have a total current of 8 A per terminal point. The maximum current carrying capacity of 8 A must not be exceeded. If the total output current in your application is > 8 A, the module is to be supplied via a minimum of two GND terminal points (0V).

The supply points have the same ground potential. All ground supplies on a module are electrically connected with one another. The communications power is also electrically connected via all contacts. In this way it can supply all potentials with just one supply without the need for additional terminals, see "Connection example" on page 10.

#### Terminal Point Assignment of the INTERBUS Connectors (Connectors X 3 and X4 in Figure 4 on page 8)

Figure 5 Assignment of the remote bus interfaces (D-SUB connector)

- A Remote OUT (outgoing remote bus)
- B Remote IN (incoming remote bus)

## **Connection Example**

Figure 6 Connection example

| R | The numbers above the module illustration identify the connector slots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | When connecting the actuators observe the assignment of the terminal points to the process data (see "Process Data" on page 11).                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | The module has an FE spring (metal clip) on<br>the bottom of the electronics base. This<br>spring creates an electrical connection to the<br>DIN rail. Use grounding terminals to connect<br>the DIN rail to protective earth ground. The<br>module is grounded when it is snapped onto<br>the DIN rail.<br>To ensure reliable functional earth<br>grounding of the module even when the DIN<br>rail is dirty or the metal clip is damaged,<br>Phoenix Contact also recommends<br>grounding the module via one of the FE<br>terminal points. |
