

VNN7NV04P-E, VNS7NV04P-E

OMNIFET II

fully autoprotected Power MOSFET

Features

Type	$R_{DS(on)}$	I_{lim}	V_{clamp}
VNN7NV04P-E VNS7NV04P-E	60 m Ω	6 A	40 V

- Linear current limitation
- Thermal shutdown
- Short circuit protection
- Integrated clamp
- Low current drawn from input pin
- Diagnostic feedback through input pin
- ESD protection
- Direct access to the gate of the Power MOSFET (analog driving)
- Compatible with standard Power MOSFET in compliance with the 2002/95/EC European Directive

Description

The VNN7NV04P-E, VNS7NV04P-E, are monolithic devices designed in STMicroelectronics VIPower™ M0-3 Technology, intended for replacement of standard Power MOSFETs from DC up to 50 kHz applications. Built in thermal shutdown, linear current limitation and overvoltage clamp protect the chip in harsh environments.

Fault feedback can be detected by monitoring the voltage at the input pin.

1. Pulsed: Pulse duration = 300 μs , duty cycle 1.5 %

3 Protection features

During normal operation, the input pin is electrically connected to the gate of the internal Power MOSFET through a low impedance path.

The device then behaves like a standard Power MOSFET and can be used as a switch from DC up to 50 kHz. The only difference from the user's standpoint is that a small DC current I_{ISS} (typ. 100 μ A) flows into the input pin in order to supply the internal circuitry.

The device integrates:

- Overvoltage clamp protection: internally set at 45 V, along with the rugged avalanche characteristics of the Power MOSFET stage give this device unrivalled ruggedness and energy handling capability. This feature is mainly important when driving inductive loads.
- Linear current limiter circuit: limits the drain current I_D to I_{lim} whatever the input pin voltages. When the current limiter is active, the device operates in the linear region, so power dissipation may exceed the capability of the heatsink. Both case and junction temperatures increase, and if this phase lasts long enough, junction temperature may reach the overtemperature threshold T_{jsh} .
- Overtemperature and short circuit protection: these are based on sensing the chip temperature and are not dependent on the input voltage. The location of the sensing element on the chip in the power stage area ensures fast, accurate detection of the junction temperature. Overtemperature cutout occurs in the range 150 to 190 °C, a typical value being 170 °C. The device is automatically restarted when the chip temperature falls of about 15 °C below shutdown temperature.
- Status feedback: in the case of an overtemperature fault condition ($T_j > T_{jsh}$), the device tries to sink a diagnostic current I_{gf} through the input pin in order to indicate fault condition. If driven from a low impedance source, this current may be used in order to warn the control circuit of a device shutdown. If the drive impedance is high enough so that the input pin driver is not able to supply the current I_{gf} , the input pin falls to 0 V. This however not affects the device operation: no requirement is put on the current capability of the input pin driver except to be able to supply the normal operation drive current I_{ISS} .

Additional features of this device are ESD protection according to the Human Body model and the ability to be driven from a TTL logic circuit.

3.2 SO-8 maximum demagnetization energy

Figure 30. SO-8 maximum turn-off current versus load inductance

Legend

- A = Single Pulse at $T_{Jstart} = 150\text{ }^{\circ}\text{C}$
- B = Repetitive pulse at $T_{Jstart} = 100\text{ }^{\circ}\text{C}$
- C = Repetitive Pulse at $T_{Jstart} = 125\text{ }^{\circ}\text{C}$

Conditions:

$V_{CC} = 13.5\text{ V}$

Values are generated with $R_L = 0\text{ }\Omega$. In case of repetitive pulses, T_{Jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

Figure 31. SO-8 demagnetization
