1 Introduction

The TPS54627 is a single, adaptive on-time, D-CAP2™-mode, synchronous buck converter that requires a low external component count. The D-CAP2™ control circuit is optimized for low-ESR output capacitors such as POSCAP, SP-CAP, or ceramic types and features fast transient response with no external compensation. The switching frequency is internally set at a nominal 650 kHz. The high-side and low-side switching MOSFETs are incorporated inside the TPS54627 package along with the gate-drive circuitry. The low drain-to-source on-resistance of the MOSFETs allows the TPS54627 to achieve high efficiencies and helps keep the junction temperature low at high-output currents. The TPS54627 DC/DC synchronous converter is designed to provide up to a 6-A output from an input voltage source of 4.5 V to 18 V. The output voltage range is from 0.76 V to 5.5 V. Rated input voltage and output current range for the evaluation module are given in [Table 1-1](#).

The TPS54627EVM-052 evaluation module circuit is a single, synchronous buck converter providing 1.05 V at 6 A from 4.5-V to 18-V input. This user's guide describes the TPS54627EVM-052 performance.

3 Modifications

These evaluation modules are designed to provide access to the features of the TPS54627. Some modifications can be made to this module.

3.1 Output Voltage Setpoint

To change the output voltage of the EVMs, it is necessary to change the value of resistor R1. Changing the value of R1 can change the output voltage above 0.765 V. The value of R1 for a specific output voltage can be calculated using [Equation 1](#).

For output voltage from 0.76 V to 5.5 V:

$$V_O = 0.765 \times \left(1 + \frac{R_1}{R_2} \right) \quad (1)$$

[Table 3-1](#) lists the R1 values for some common output voltages. A feedforward capacitor (C4) may be used to improve phase margin. Feedforward capacitors are most effective for higher output voltages of 1.8 V or above. Pads for this component (C4) are provided on the printed-circuit board (PCB). Note that the resistor values given in [Table 3-1](#) are standard values and not the exact value calculated using [Equation 1](#).

3.2 Output Filter and Closed-Loop Response

The TPS54627 relies on the output filter characteristics to ensure stability of the control loop. The recommended output filter components for common output voltages are given in [Table 3-1](#). It is possible for other output filter component values to provide acceptable closed-loop characteristics. R3 and TP4 are provided for convenience in breaking the control loop and measuring the closed-loop response.

4 Test Setup and Results

This section describes how to properly connect, set up, and use the TPS54627EVM-052. The section also includes test results typical for the evaluation modules and efficiency, output load regulation, output line regulation, load transient response, output voltage ripple, input voltage ripple, start-up, and switching frequency.

4.1 Input/Output Connections

The TPS54627EVM-052 is provided with input and output connectors and test points as shown in [Table 4-1](#). A power supply capable of supplying 3 A must be connected to J1 through a pair of 20-AWG wires. The load must be connected to J2 through a pair of 20-AWG wires. The maximum load current capability is 6 A. Wire lengths must be minimized to reduce losses in the wires. Test point TP1 provides a place to monitor the V_{IN} input voltages with TP2 providing a convenient ground reference. TP8 is used to monitor the output voltage with TP9 as the ground reference.

5 Board Layout

This section provides description of the TPS54627EVM-052, board layout, and layer illustrations.

5.1 Layout

The board layout for the TPS54627EVM-052 is shown in [Figure 5-1](#) through [Figure 5-5](#). The top layer contains the main power traces for VIN, VOUT, and ground. Also on the top layer are connections for the pins of the TPS54628 and a large area filled with ground. Most of the signal traces also are located on the top side. The input decoupling capacitors are located as close to the IC as possible. The input and output connectors, test points, and all of the components are located on the top side. An analog ground (GND) area is provided on the top side. Analog ground (GND) and power ground (PGND) are connected at a single point on the top layer near C6. The two internal layers are completely dedicated to power ground planes. The bottom layer is primarily power ground. Traces also connect VIN to the enable control jumper, VREG5 test points and the feedback trace from VOUT to the voltage setpoint divider network.
