BGM121/BGM123 Blue Gecko *Bluetooth* ® SiP Module Data Sheet

The BGM121/BGM123 Blue Gecko *Bluetooth* ® SiP Module family is targeted for applications where ultra-small size, reliable high performance RF, low-power consumption and easy application development are key requirements.

At 6.5 x 6.5 x 1.4 mm the BGM121/BGM123 module fits applications where size is a constraint. BGM121/BGM123 also integrates a high performance, ultra robust antenna, which requires minimal PCB, plastic and metal clearance. The total PCB area required by BGM121/BGM123 is only 51 mm^2. The BGM121/BGM123 has Bluetooth, CE, partial FCC, ISED Canada and Japan certifications.

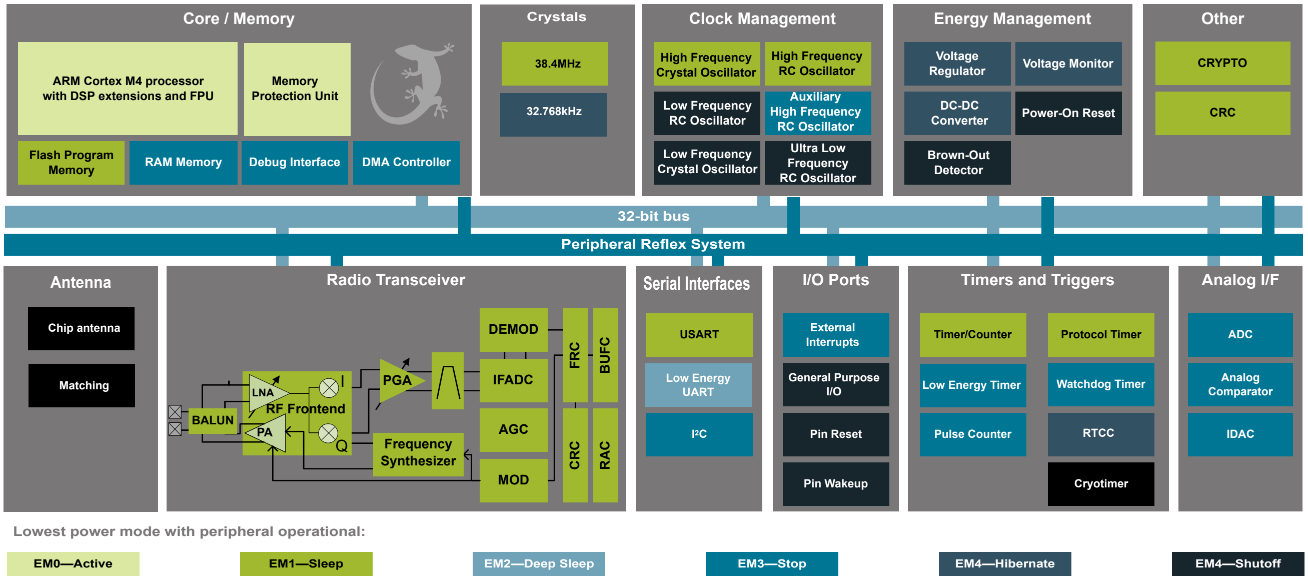
Based on the EFR32BG1 SoC, the BGM121/BGM123 also integrates a *Bluetooth* 4.2 compliant Bluetooth Low Energy and it can also run end-user applications on-board or alternatively used as a network co-processor over one of the host interfaces.

BGM121/BGM123 SIP modules can be used in a wide variety of applications:

- Wearables
- IoT end devices and gateways
- Health, sports and wellness devices
- Industrial, home and building automation
- Smart phone, tablet and PC accessories
- Beacons

KEY FEATURES

- Bluetooth 4.2 low energy compliant
- Integrated antenna or RF pin
- TX power up to +8 dBm
- RX sensitivity: -90 dBm
- Range: up to 200 meters
- 32-bit ARM® Cortex®-M4 core at 38.4 MHz
- Flash memory: 256 kB
- RAM: 32 kB
- Autonomous Hardware Crypto Accelerator and Random Number Generator
- Integrated DC-DC Converter
- Onboard Bluetooth stack



1. Feature List

The BGM121/BGM123 highlighted features are listed below.

- **Low Power Wireless System-on-Chip**.
  - High Performance 32-bit 38.4 MHz ARM Cortex®-M4 with DSP instruction and floating-point unit for efficient signal processing
  - 256 kB flash program memory
  - 32 kB RAM data memory
  - 2.4 GHz radio operation
  - TX power up to +8 dBm
- **Low Energy Consumption**
  - 8.7 mA RX current at 2.4 GHz
  - 8.2 mA TX current @ 0 dBm output power at 2.4 GHz
  - 63 μA/MHz in Active Mode (EM0)
  - 2.5 μA EM2 DeepSleep current (full RAM retention and RTCC running from LFXO)
  - 2.1 μA EM3 Stop current (State/RAM retention)
- **High Receiver Performance**
  - -90 dBm sensitivity @ 1 Mbit/s GFSK (2.4 GHz)
- **Supported Protocols**
  - Bluetooth® Low Energy
- **Support for Internet Security**
  - General Purpose CRC
  - Random Number Generator
  - Hardware Cryptographic Acceleration for AES 128/256, SHA-1, SHA-2 (SHA-224 and SHA-256) and ECC
- **Wide Selection of MCU peripherals**
  - 12-bit 1 Msps SAR Analog to Digital Converter (ADC)
  - 2 × Analog Comparator (ACMP)
  - Digital to Analog Current Converter (IDAC)
  - 32 pins connected to analog channels (APORT) shared between Analog Comparators, ADC, and IDAC
  - 30 General Purpose I/O pins with output state retention and asynchronous interrupts
  - 8 Channel DMA Controller
  - 12 Channel Peripheral Reflex System (PRS)
  - 2×16-bit Timer/Counter
    - 3 + 4 Compare/Capture/PWM channels
  - 32-bit Real Time Counter and Calendar
  - 16-bit Low Energy Timer for waveform generation
  - 32-bit Ultra Low Energy Timer/Counter for periodic wake-up from any Energy Mode
  - 16-bit Pulse Counter with asynchronous operation
  - Watchdog Timer with dedicated RC oscillator @ 50 nA
  - 2×Universal Synchronous/Asynchronous Receiver/Transmitter (UART/SPI/SmartCard (ISO 7816)/IrDA/I^{2}S)
  - Low Energy UART (LEUART™)
  - I^{2}C interface with SMBus support and address recognition in EM3 Stop
- **Wide Operating Range**
  - 1.85 V to 3.8 V single power supply
  - 2.4 V to 3.8 V when using DC-DC
  - Integrated DC-DC
  - -40 °C to +85 °C
- **Dimensions**
  - 6.5 x 6.5 x 1.4 mm

3. System Overview

3.1 Introduction

The BGM121/BGM123 product family combines an energy-friendly MCU with a highly integrated radio transceiver. The devices are well suited for any battery operated application, as well as other system requiring high performance and low-energy consumption. This section gives a short introduction to the full radio and MCU system. A detailed functional description can be found in the *EFR32BG1 Wireless Gecko Bluetooth® Low Energy SoC Family Data Sheet* (see general sections and QFN48 2.4 GHz SoC related sections).

A detailed block diagram of the EFR32BG SoC is shown in the figure below which is used in the BGM121/BGM123 Bluetooth Low Energy module.

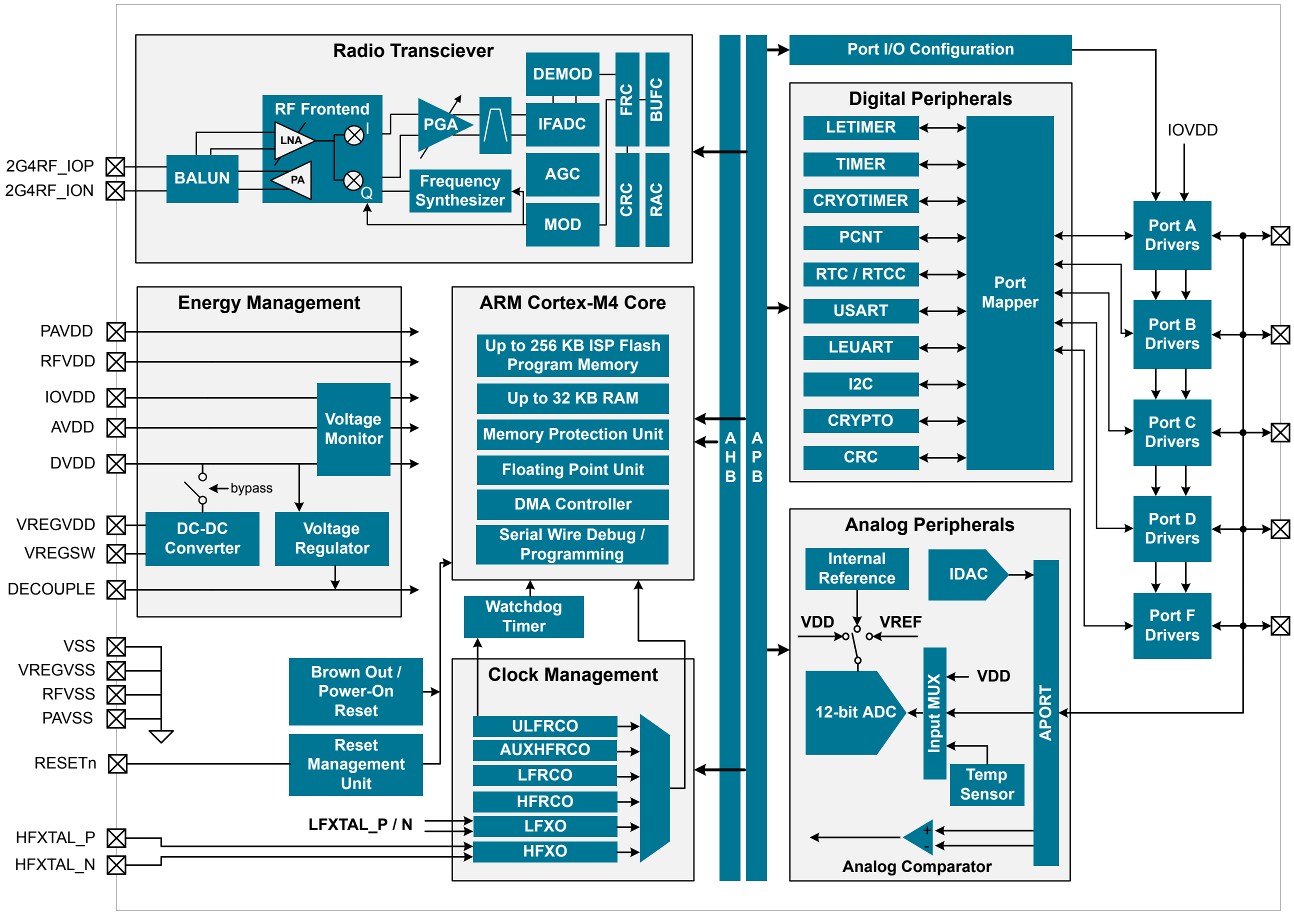

Figure 3.1. Detailed EFR32BG1 Block Diagram

3.2 Radio

The BGM121/BGM123 features a radio transceiver supporting Bluetooth® low energy protocol.

3.2.1 Antenna Interface

BGM121/BGM123 has a built in 2.4GHz ceramic chip antenna or 50 ohm RF pin.

Table 3.1. Antenna Efficiency and Peak Gain

Parameter	With optimal layout	Note
Efficiency	-1 to -2 dB	Efficiency and peak gain depend on the application PCB layout and mechanical design and the used antenna.
Peak gain	1 dBi	

3.2.2 Packet and State Trace

The BGM121/BGM123 Frame Controller has a packet and state trace unit that provides valuable information during the development phase. It features:

- Non-intrusive trace of transmit data, receive data and state information
- Data observability on a single-pin UART data output, or on a two-pin SPI data output
- Configurable data output bitrate / baudrate
- Multiplexed transmitted data, received data and state / meta information in a single serial data stream

3.2.3 Random Number Generator

The Frame Controller (FRC) implements a random number generator that uses entropy gathered from noise in the RF receive chain. The data is suitable for use in cryptographic applications.

Output from the random number generator can be used either directly or as a seed or entropy source for software-based random number generator algorithms such as Fortuna.

3.3 Power

The BGM121/BGM123 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An integrated dc-dc buck regulator is utilized to further reduce the current consumption.

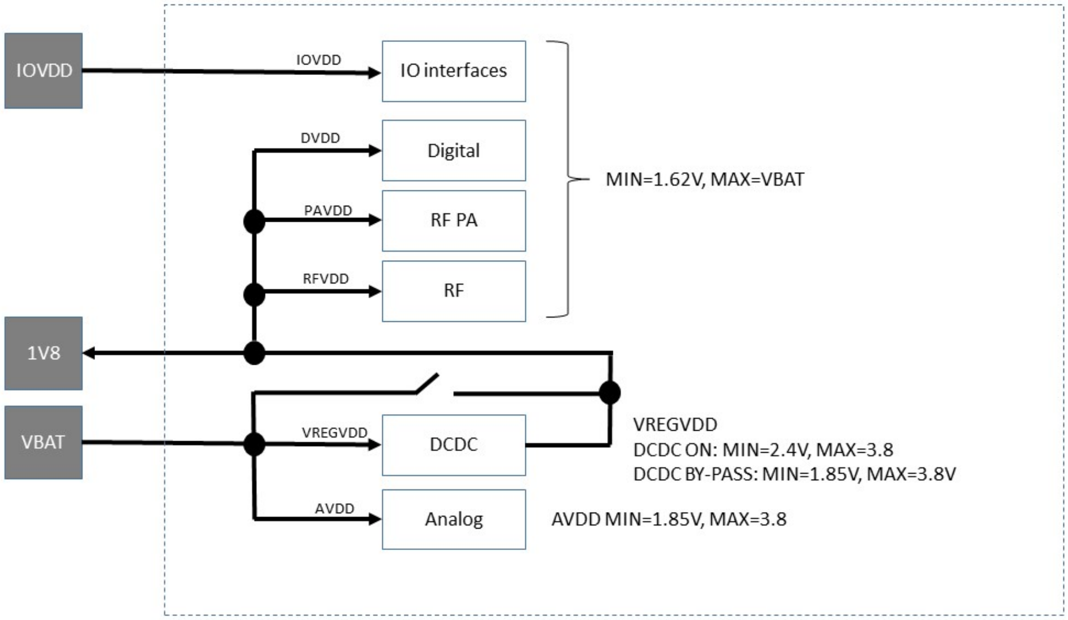

Figure 3.2. Power Supply Configuration

3.3.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to turn off the power to unused RAM blocks, and it contains control registers for the dc-dc regulator and the Voltage Monitor (VMON). The VMON is used to monitor multiple supply voltages. It has multiple channels which can be programmed individually by the user to determine if a sensed supply has fallen below a chosen threshold.

3.3.2 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents and provides up to 90% efficiency in energy modes EM0, EM1, EM2 and EM3. Patented RF noise mitigation allows operation of the DC-DC converter without degrading sensitivity of radio components. Protection features include programmable current limiting, short-circuit protection, and dead-time protection. The DC-DC converter may also enter bypass mode when the input voltage is too low for efficient operation. In bypass mode, the DC-DC input supply is internally connected directly to its output through a low resistance switch. Bypass mode also supports in-rush current limiting to prevent input supply voltage droops due to excessive output current transients.

3.4 General Purpose Input/Output (GPIO)

BGM121/BGM123 has up to 30 General Purpose Input/Output pins. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

3.5 Clocking

3.5.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the BGM121/BGM123. Individual enabling and disabling of clocks to all peripheral modules is perfomed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

3.5.2 Internal Oscillators

The BGM121/BGM123 fully integrates two crystal oscillators and four RC oscillators, listed below.

- A 38.4MHz high frequency crystal oscillator (HFXO) provides a precise timing reference for the MCU and radio.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system, when crystal accuracy is not required. The HFRCO employs fast startup at minimal energy consumption combined with a wide frequency range.
- An integrated auxilliary high frequency RC oscillator (AUXHFRCO) is available for timing the general-purpose ADC and the Serial Wire debug port with a wide frequency range.
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) can be used as a timing reference in low energy modes, when crystal accuracy is not required.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

3.6 Counters/Timers and PWM

3.6.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each TIMER is a 16-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit TIMER_0 only.

3.6.2 Real Time Counter and Calendar (RTCC)

The Real Time Counter and Calendar (RTCC) is a 32-bit counter providing timekeeping in all energy modes. The RTCC includes a Binary Coded Decimal (BCD) calendar mode for easy time and date keeping. The RTCC can be clocked by any of the on-board oscillators with the exception of the AUXHFRCO, and it is capable of providing system wake-up at user defined instances. When receiving frames, the RTCC value can be used for timestamping. The RTCC includes 128 bytes of general purpose data retention, allowing easy and convenient data storage in all energy modes.

3.6.3 Low Energy Timer (LETIMER)

The unique LETIMER is a 16-bit timer that is available in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Real Time Counter and Calendar (RTCC), and can be configured to start counting on compare matches from the RTCC.

3.6.4 Ultra Low Power Wake-up Timer (CRYOTIMER)

The CRYOTIMER is a 32-bit counter that is capable of running in all energy modes. It can be clocked by either the 32.768 kHz crystal oscillator (LFXO), the 32.768 kHz RC oscillator (LFRCO), or the 1 kHz RC oscillator (ULFRCO). It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode. The CRYOTIMER provides a wide range of interrupt periods, facilitating flexible ultra-low energy operation.

3.6.5 Pulse Counter (PCNT)

The Pulse Counter (PCNT) peripheral can be used for counting pulses on a single input or to decode quadrature encoded inputs. The clock for PCNT is selectable from either an external source on pin PCTNn_S0IN or from an internal timing reference, selectable from among any of the internal oscillators, except the AUXHFRCO. The module may operate in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop.

3.6.6 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by PRS.

3.7 Communications and Other Digital Peripherals

3.7.1 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous/Asynchronous Receiver/Transmitter is a flexible serial I/O module. It supports full duplex asynchronous UART communication with hardware flow control as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with devices supporting:

- ISO7816 SmartCards
- IrDA
- I^2S

3.7.2 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique LEUART™ provides two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud. The LEUART includes all necessary hardware to make asynchronous serial communication possible with a minimum of software intervention and energy consumption.

3.7.3 Inter-Integrated Circuit Interface (I^2C)

The I^2C module provides an interface between the MCU and a serial I^2C bus. It is capable of acting as both a master and a slave and supports multi-master buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the I^2C module allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of slave addresses is provided in active and low energy modes.

3.7.4 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripheral modules without software involvement. Peripheral modules producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals which in turn perform actions in response. Edge triggers and other functionality can be applied by the PRS. The PRS allows peripheral to act autonomously without waking the MCU core, saving power.

3.8 Security Features

3.8.1 GPCRC (General Purpose Cyclic Redundancy Check)

The GPCRC module implements a Cyclic Redundancy Check (CRC) function. It supports both 32-bit and 16-bit polynomials. The supported 32-bit polynomial is 0x04C11DB7 (IEEE 802.3), while the 16-bit polynomial can be programmed to any value, depending on the needs of the application.

3.8.2 Crypto Accelerator (CRYPTO)

The Crypto Accelerator is a fast and energy-efficient autonomous hardware encryption and decryption accelerator. It supports AES encryption and decryption with 128- or 256-bit keys and ECC over both GF(P) and GF(2^m), SHA-1 and SHA-2 (SHA-224 and SHA-256).

Supported modes of operation for AES include: ECB, CTR, CBC, PCBC, CFB, OFB, CBC-MAC, GMAC and CCM.

Supported ECC NIST recommended curves include P-192, P-224, P-256, K-163, K-233, B-163 and B-233.

The CRYPTO is tightly linked to the Radio Buffer Controller (BUFC) enabling fast and efficient autonomous cipher operations on data buffer content. It allows fast processing of GCM (AES), ECC and SHA with little CPU intervention. CRYPTO also provides trigger signals for DMA read and write operations.

3.9 Analog

3.9.1 Analog Port (APORT)

The Analog Port (APORT) is an analog interconnect matrix allowing access to analog modules ADC, ACMP, and IDAC on a flexible selection of pins. Each APORT bus consists of analog switches connected to a common wire. Since many clients can operate differentially, buses are grouped by X/Y pairs.

3.9.2 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs are selected from among internal references and external pins. The tradeoff between response time and current consumption is configurable by software. Two 6-bit reference dividers allow for a wide range of internally-programmable reference sources. The ACMP can also be used to monitor the supply voltage. An interrupt can be generated when the supply falls below or rises above the programmable threshold.

3.9.3 Analog to Digital Converter (ADC)

The ADC is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to 1 MSamples/s. The output sample resolution is configurable and additional resolution is possible using integrated hardware for averaging over multiple samples. The ADC includes integrated voltage references and an integrated temperature sensor. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

3.9.4 Digital to Analog Current Converter (IDAC)

The Digital to Analog Current Converter can source or sink a configurable constant current. This current can be driven on an output pin or routed to the selected ADC input pin for capacitive sensing. The current is programmable between 0.05 µA and 64 µA with several ranges with various step sizes.

3.10 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the BGM121/BGM123. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset and watchdog reset.

3.11 Core and Memory

3.11.1 Processor Core

The ARM Cortex-M4F processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M4F RISC processor achieving 1.25 Dhrystone MIPS/MHz
- Memory Protection Unit (MPU) supporting up to 8 memory segments
- 256 KB flash program memory
- 32 KB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire debug interface

3.11.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M and DMA. The flash memory is divided into two blocks; the main block and the information block. Program code is normally written to the main block, whereas the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

3.11.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller features 8 channels capable of performing memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

3.12 Memory Map

The BGM121/BGM123 memory map is shown in the figures below.

3.13 Configuration Summary

The features of the BGM121/BGM123 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

Table 3.2. Configuration Summary

Module	Configuration	Pin Connections
USART0	IrDA SmartCard	US0_TX, US0_RX, US0_CLK, US0_CS
USART1	IrDA I^2S SmartCard	US1_TX, US1_RX, US1_CLK, US1_CS
TIMER0	with DTI	TIM0_CC[2:0], TIM0_CDTI[2:0]
TIMER1		TIM1_CC[3:0]

4. Electrical Specifications

4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on T_{AMB}=25 °C and V_{DD}= 3.3 V, by production test and/or technology characterization.
- Radio performance numbers are measured in conducted mode, based on Silicon Laboratories reference designs using output power-specific external RF impedance-matching networks for interfacing to a 50 Ω antenna.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

Refer to Table 4.2 General Operating Conditions on page 17 for more details about operational supply and temperature limits.

4.1.1 Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at http://www.silabs.com/support/quality/pages/default.aspx.

Table 4.1. Absolute Maximum Ratings

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage temperature range	T_{STG}		-40	—	+85	°C
External main supply voltage	V_{DDMAX}		0	—	3.8	V
External main supply voltage ramp rate	$V_{DDRAMPMAX}$		—	—	1	V / µs
External main supply voltage with DC-DC in bypass mode			1.85		3.8	V
Voltage on any 5V tolerant GPIO pin[1]	V_{DIGPIN}		-0.3	—	Min of 5.25 and IOVDD +2	V
Voltage on non-5V tolerant GPIO pins			-0.3	—	IOVDD+0.3	V
Max RF level at input	$P_{RFMAX2G4}$		—	—	10	dBm
Total current into VDD power lines (source)	I_{VDDMAX}		—	—	200	mA
Total current into VSS ground lines (sink)	I_{VSSMAX}		—	—	200	mA
Current per I/O pin (sink)	I_{IOMAX}		—	—	50	mA
Current per I/O pin (source)			—	—	50	mA
Current for all I/O pins (sink)	$I_{IOALLMAX}$		—	—	200	mA
Current for all I/O pins (source)			—	—	200	mA
Voltage difference between AVDD and VREGVDD	ΔV_{DD}		—	—	0.3	V

Note:

1. When a GPIO pin is routed to the analog module through the APORT, the maximum voltage = IOVDD.

4.1.2 Operating Conditions

The following subsections define the operating conditions for the module.

4.1.2.1 General Operating Conditions

Table 4.2. General Operating Conditions

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Operating temperature range	T_{OP}	Ambient temperature range	-40	25	85	°C
VDD Operating supply voltage [1]	V_{VDD}	DCDC in regulation	2.4[3]	3.3	3.8	V
		DCDC in bypass, 50mA load	1.85	3.3	3.8	V
VDD Current	I_{VDD}	DCDC in bypass	—	—	200	mA
HFCLK frequency	f_{CORE}	0 wait-states (MODE = WS0) [2]	—	—	26	MHz
		1 wait-states (MODE = WS1) [2]	—	38.4	40	MHz

Note:

1. The minimum voltage required in bypass mode is calculated using R_{BYP} from the DC-DC specification table. Requirements for other loads can be calculated as $V_{VDD\_min}+I_{LOAD} * R_{BYP\_max}$
2. In MSC_READCTRL register
3. The minimum voltage of 2.4 V for DCDC is specified at 100 mA

4.1.3 DC-DC Converter

Test conditions: V_{DCDC_I}=3.3 V, V_{DCDC_O}=1.8 V, I_{DCDC_LOAD}=50 mA, Heavy Drive configuration, F_{DCDC_LN}=7 MHz, unless otherwise indicated.

Table 4.3. DC-DC Converter

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Input voltage range	V_{DCDC_I}	Bypass mode, I_{DCDC_LOAD} = 50 mA	1.85	—	$V_{VREGVDD\_MAX}$	V
		Low noise (LN) mode, 1.8 V output, I_{DCDC_LOAD} = 100 mA, or Low power (LP) mode, 1.8 V output, I_{DCDC_LOAD} = 10 mA	2.4	—	$V_{VREGVDD\_MAX}$	V
		Low noise (LN) mode, 1.8 V output, I_{DCDC_LOAD} = 200 mA	2.6	—	$V_{VREGVDD\_MAX}$	V
Output voltage programmable range[1]	V_{DCDC_O}		1.8	—	$V_{VREGVDD}$	V
Regulation DC Accuracy	ACC_{DC}	Low noise (LN) mode, 1.8 V target output	1.7	—	1.9	V
Regulation Window[2]	WIN_{REG}	Low power (LP) mode, LPCMPBIAS[3] = 0, 1.8 V target output, I_{DCDC_LOAD} ≤ 75 μA	1.63	—	2.2	V
		Low power (LP) mode, LPCMPBIAS[3] = 3, 1.8 V target output, I_{DCDC_LOAD} ≤ 10 mA	1.63	—	2.1	V
Steady-state output ripple	V_R	Radio disabled.	—	3	—	mVpp
Output voltage under/overshoot	V_{OV}	CCM Mode (LNFORCECCM[3] = 1), Load changes between 0 mA and 100 mA	—	—	150	mV
		DCM Mode (LNFORCECCM[3] = 0), Load changes between 0 mA and 10 mA	—	—	150	mV
		Overshoot during LP to LN CCM/DCM mode transitions compared to DC level in LN mode	—	200	—	mV
		Undershoot during BYP/LP to LN CCM (LNFORCECCM[3] = 1) mode transitions compared to DC level in LN mode	—	50	—	mV
		Undershoot during BYP/LP to LN DCM (LNFORCECCM[3] = 0) mode transitions compared to DC level in LN mode	—	125	—	mV
DC line regulation	V_{REG}	Input changes between $V_{VREGVDD\_MAX}$ and 2.4 V	—	0.1	—	%
DC load regulation	I_{REG}	Load changes between 0 mA and 100 mA in CCM mode	—	0.1	—	%

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit

Note:

1. Due to internal dropout, the DC-DC output will never be able to reach its input voltage, $V_{VREGVDD}$
2. LP mode controller is a hysteretic controller that maintains the output voltage within the specified limits
3. In EMU_DCDCMISCCTRL register
4. Drive levels are defined by configuration of the PFETCNT and NFETCNT registers. Light Drive: PFETCNT=NFETCNT=3; Medium Drive: PFETCNT=NFETCNT=7; Heavy Drive: PFETCNT=NFETCNT=15.

4.1.4 Current Consumption

4.1.4.1 Current Consumption 3.3 V (DC-DC in Bypass Mode)

Unless otherwise indicated, typical conditions are: VDD = 3.3 V. T_{OP} = 25 °C. EMU_PWRCFG_PWRCG=NODCDC. EMU_DCDCCTRL_DCDCMODE=BYPASS. Minimum and maximum values in this table represent the worst conditions across supply voltage and process variation at T_{OP} = 25 °C.

Table 4.4. Current Consumption 3.3V without DC/DC

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Current consumption in EM0 Active mode with all peripherals disabled	I_{ACTIVE}	38.4 MHz crystal, CPU running while loop from flash[1]	—	130	—	µA/MHz
		38 MHz HFRCO, CPU running Prime from flash	—	88	—	µA/MHz

5. Typical Connection Diagrams

5.1 Typical Connections

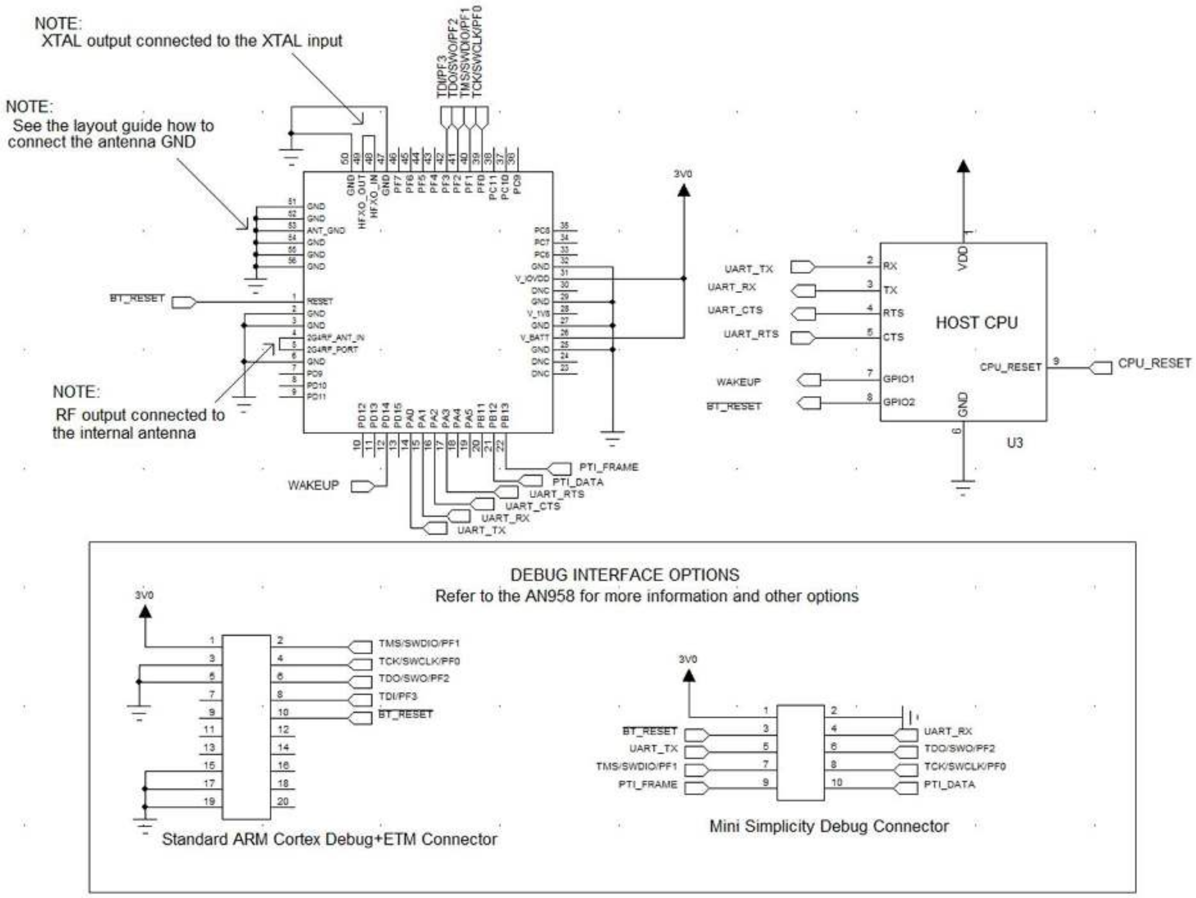
The figure below shows a typical reference schematic and how to connect:

- Power supplies and Ground pins
- Antenna loop for internal antenna usage
- XTAL loop
- Debug port
- Reset line
- Optional UART connection to an external host for Network Co-Processor (NCP) usage

Note: It's recommended to connect the reset line to the host CPU when NCP mode is used.

Note: The V_1V8 pin is the 1.8V output of the internal DC-DC converter. This pin should be left unconnected. Do not add external decoupling or power external circuits from this pin.

Figure 5.1. Typical Connections



6. Layout Guidelines

For optimal performance of the BGM121/BGM123, please follow the PCB layout guidelines and ground plane recommendations indicated in this section.

6.1 Layout Guidelines

This section contains generic PCB layout and design guidelines for the BGM121/BGM123 module. Generally, please follow these guidelines:

- Place the module at the edge of the PCB, as shown in the figures in this chapter.
- Do not place any metal (traces, components, etc.) in the antenna clearance area.
- Connect all ground pads directly to a solid ground plane.
- Place the ground vias as close to the ground pads as possible.

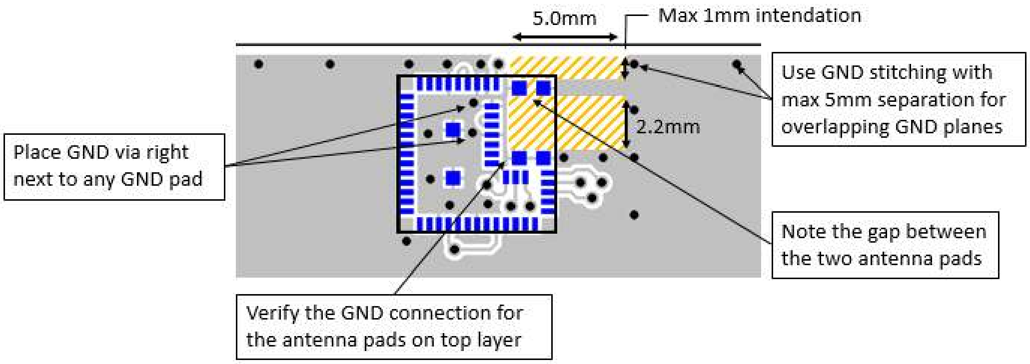


Figure 6.1. BGM121/BGM123 PCB Top Layer Design

Following rules are recommended for the PCB design:

- Trace to copper clearance 150 µm
- PTH drill size 300 µm
- PTH annular ring 150 µm

Important:

The antenna area must align with the pads precisely. Please refer to the recommended PCB land pattern for exact dimensions.

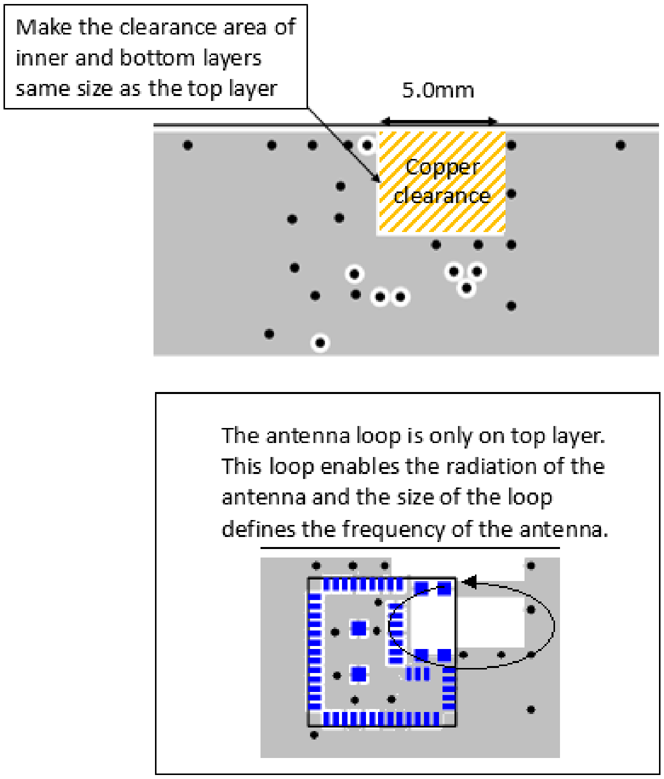

Figure 6.2. BGM121/BGM123 PCB Middle and Bottom Layer Design

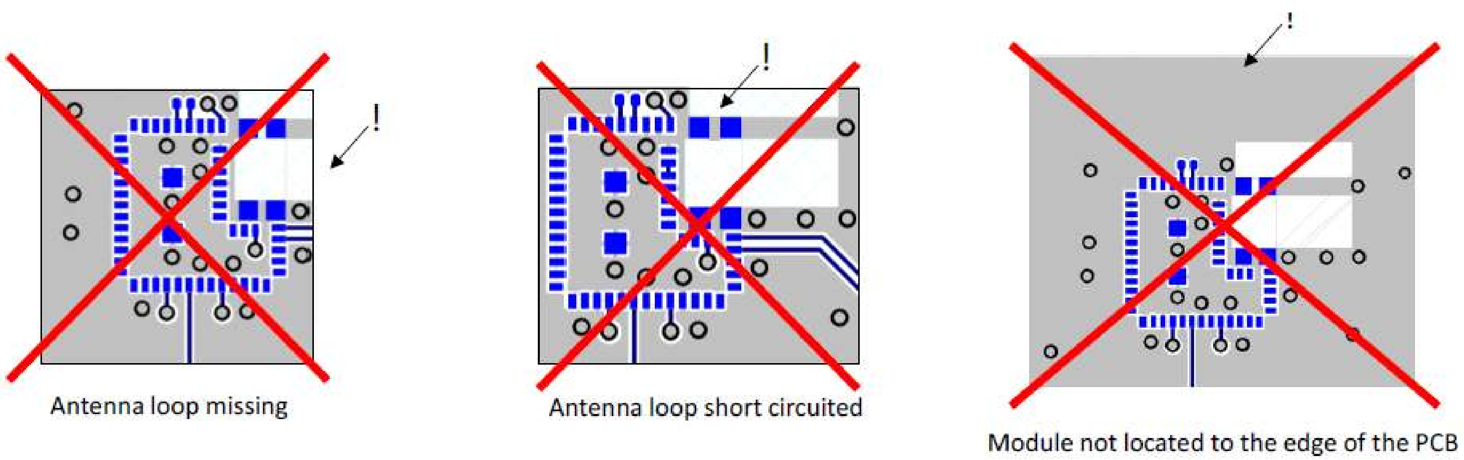

Figure 6.3. Poor Layout Designs for the BGM121/BGM123

Layout checklist for BGM121/BGM123:

1. Antenna area is aligned relative to the module pads as shown in the recommended PCB land pattern
2. Clearance area within the inner layers and bottom layer is covering the whole antenna area as shown in the layoyt guidelines
3. The antenna loop is implemented on top layer as shown in the layoyt guidelines
4. All dimensions within the antenna area are precisely as shown in the recommended PCB land pattern
5. The module is placed to the edge of the PCB with max 1mm intendation
6. The mdoule is not placed to the corner of the PCB

6.2 Effect of PCB Width

The BGM121/BGM123 module should be placed at the center of the PCB edge because the width of the board has an impact to the radiated efficiency but more importantly there should be enough ground plane on both sides of the module for optimal antenna performance. The figure below gives an indcation of ground plane size vs. maximum achievable range.

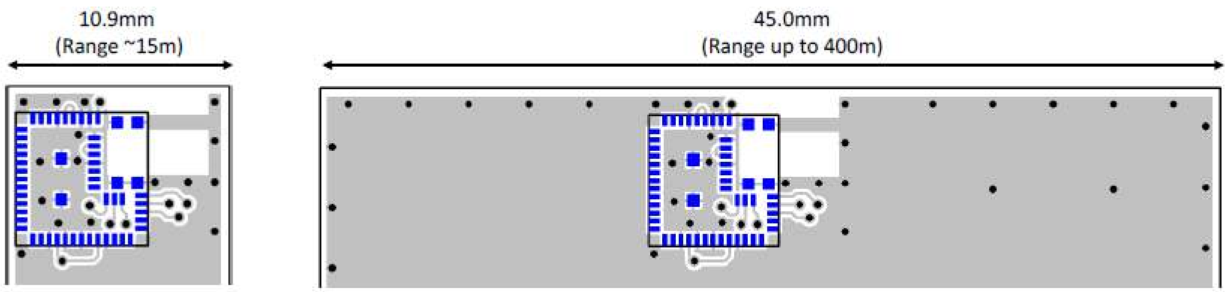

Figure 6.4. BGM121/BGM123 PCB Top Layer Design

The impact of the board size to the radiated performance is a generic feature of all PCB and chip antennas and it is not a unique feature of BGM121/BGM123. In case of BGM121/BGM123 the depth of the board is not important and it doesn't impact the radiated performance.

6.3 Effect of Plastic and Metal Materials

The antenna on the BGM121/BGM123. is insensitive to the effects of nearby plastic and other materials with low dielectric constant and no separation between the BGM121/BGM123. and plastic or other materials is needed. Also the board thickness doesn't have any impact the module.

Any metal within the antenna area or in close proximity to the antenna area may detune the antenna. In this case it is possible to retune the antenna by adjusting the width of the antenna loop. To avoid detuning of the antenna the minimum distance to any metal should be more than 3mm. Encapsulating the module inside metal casing will prevent the radiation of the antenna.

Following picture shows how it is possible to adjust the frequency of the antenna. The antenna is extremely robust against any objects in close proximity or in direct touch with the antenna and it is recommended not to adjust the dimensions of the antenna area unless it is clear that a metal object, such as a coin cell battery, within the antenna area is detuning the antenna.

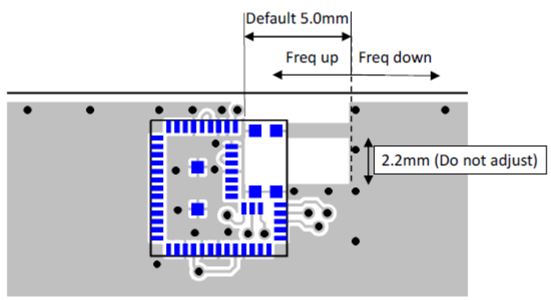

Figure 6.5. Tuning the Antenna by Adjusting the Width of the Antenna Loop

6.4 Effect of Human Body

Placing the module in touch or very close to the human body will negatively impact antenna efficiency and reduce range.

7.1.1 GPIO Overview

The GPIO pins are organized as 16-bit ports indicated by letters A through F, and the individual pins on each port are indicated by a number from 15 down to 0.

Table 7.2. GPIO Pinout

Port	Pin 15	Pin 14	Pin 13	Pin 12	Pin 11	Pin 10	Pin 9	Pin 8	Pin 7	Pin 6	Pin 5	Pin 4	Pin 3	Pin 2	Pin 1	Pin 0
Port A	-	-	-	-	-	-	-	-	-	-	PA5 (5V)	PA4 (5V)	PA3 (5V)	PA2 (5V)	PA1	PA0
Port B			PB13 [2] (5V)	PB12 [2](5V)	PB11 [2] (5V)	-	-	-	-	-	-	-	-	-	-	-
Port C	-	-	-	-	PC11 (5V)	PC10 (5V)	PC9 (5V)	PC8 (5V)	PC7 (5V)	PC6 (5V)	-	-	-	-	-	-
Port D	PD15 [2] (5V)	PD14 [2] (5V)	PD13 [2] (5V)	PD12 (5V)	PD11 (5V)	PD10 (5V)	PD9 (5V)	-	-	-	-	-	-	-	-	-
Port F	-	-	-	-	-	-	-	-	PF7 (5V)	PF6 (5V)	PF5 (5V)	PF4 (5V)	PF3 (5V)	PF2 (5V)	PF1 (5V)	PF0 (5V)

Note:

1. GPIO with 5V compatibility are indicated by (5V)
2. Pins PA2, PA3, PA4, PB11, PB12, PD13, PD14 and PD15 will not be 5V compatible on all future devices.

In order to preserve upgrade options with full hardware compatibility, do not use the pins listed in Note 2 with 5V domains.

7.2 Alternate Functionality Pinout

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings.

Note: Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to LOCATION 0.

7.3 Analog Port (APORT)

The Analog Port (APORT) is an infrastructure used to connect chip pins with on-chip analog clients such as analog comparators, ADCs, and DACs. The APORT consists of wires, switches, and control needed to configurably implement the routes. Please see the device Reference Manual for a complete description.

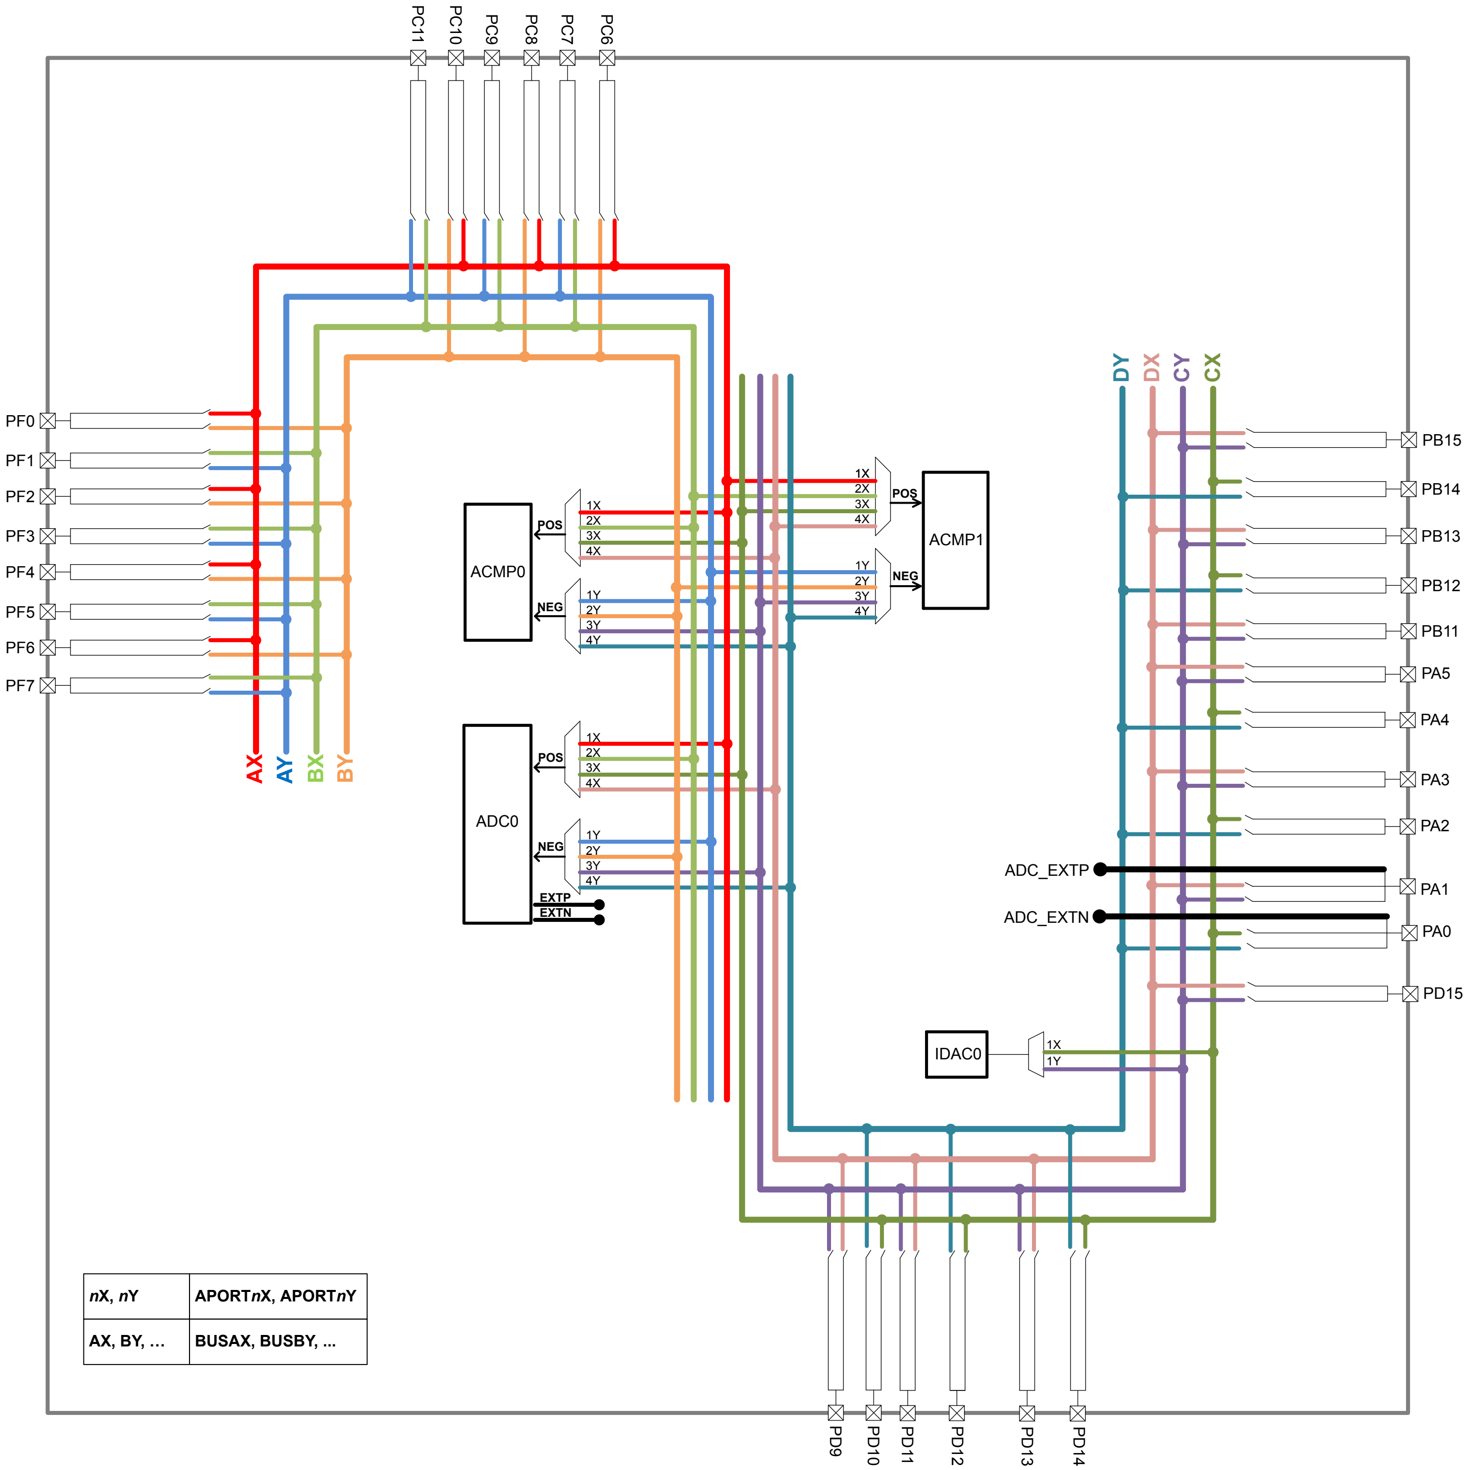

Figure 7.2. BGM121/BGM123 APORT

Client maps for each analog circuit using the APORT are shown in the following tables. The maps are organized by bus, and show the peripheral's port connection, the shared bus, and the connection from specific bus channel numbers to GPIO pins. In general, enumerations for the pin selection field in an analog peripheral's register can be determined by finding the desired pin connection in the table and then combining the value in the Port column (APORT__), and the channel identifier (CH__). For example, if pin PF7 is available on port APORT2X as CH23, the register field enumeration to connect to PF7 would be APORT2XCH23. The shared bus used by this connection is indicated in the Bus column.

Note:

1. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05mm is assumed.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on the IPC-7351 guidelines.

   Note: Soldering process specific adjustments may need to be made to the PCB land pattern.
4. The smaller rectangle pads are longer and thinner on the PCB Land Pattern(LPD) than the Package Outline Drawing(POD) (0.2 x 0.5 vs. 0.25 x 0.4). The LPD pad edge aligns with the edge of the POD pads. The centers of the respective pads do not align and that is the cause of the dimensional differences between POD and LPD.
5. Above notes and stencil design are shared as recommendations only. A user may find it necessary to use different parameters and fine tune their SMT process as required for their application and tooling.

ANTENNA LAYOUT RECOMMENDATION

This section describes the recommended PCB land pattern for the BGM121/BGM123 with X-Y cordinates of pads and the antenna copper clearance area. The X-Y cordinates of pads relative to the origo are shown in the table. The origo is the center point of pin no 53. It is very important to align the antenna area relative to the module pads precisely. This recommendation is only valid for parts with built-in antenna.

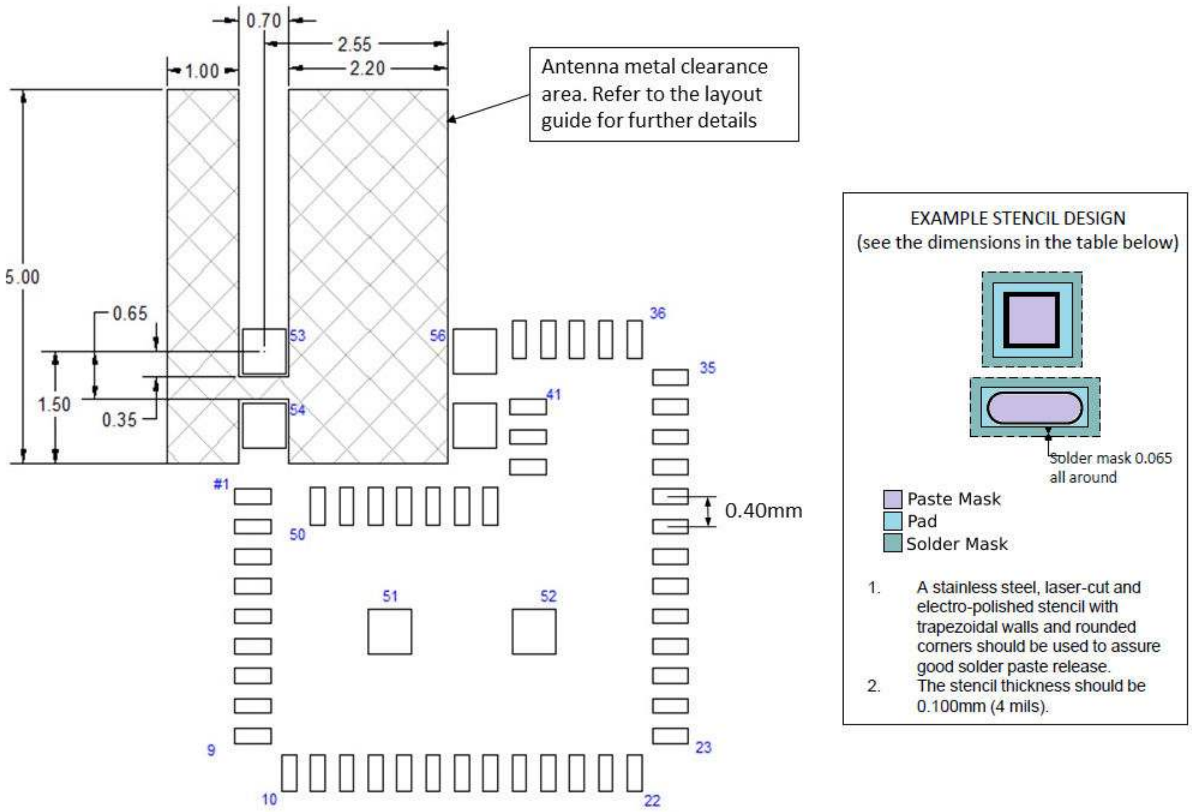

Figure 8.4. BGM121/BGM123 Recommended Land Pattern

Note: The provided stencil information is a recommendation and soldering process specific adjustments may need to be made.

9. Tape and Reel Specifications

9.1 Tape and Reel Packaging

This section contains information regarding the tape and reel packaging for the BGM121/BGM123 Blue Gecko Module.

9.2 Reel and Tape Specifications

- Reel material: Polystyrene (PS)
- Reel diameter: 13 inches (330 mm)
- Number of modules per reel: 1000 pcs
- Disk deformation, folding whitening and mold imperfections: Not allowed
- Disk set: consists of two 13 inch (330 mm) rotary round disks and one central axis (100 mm)
- Antistatic treatment: Required
- Surface resistivity: 10^4 - 10^9 Ω/sq.

10. Soldering Recommendations

10.1 Soldering Recommendations

The BGM121/BGM123 is compatible with industrial standard reflow profile for Pb-free solders. The reflow profile used is dependent on the thermal mass of the entire populated PCB, heat transfer efficiency of the oven, and particular type of solder paste used.

- Refer to technical documentations of particular solder paste for profile configurations.
- Avoid usining more than two reflow cycles.
- A no-clean, type-3 solder paste is recommended.
- A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
- Recommended stencil thickness is 0.100 mm (4 mils).
- General SMT application notes are provided in AN1223.
- For further recommendation, refer to the JEDEC/IPC J-STD-020, IPC-SM-782 and IPC 7351 guidelines.
- The above notes are recommendations only. A customer or user may find it necessary to use different parameters and fine tune their SMT process as required for their application and tooling.

11. Certifications

Refer to AN1048 for information related to Regulatory Certifications.

11.1 Bluetooth

The BGM121/BGM123 Bluetooth Declarion ID is: D033250.

11.2 CE and UKCA - EU and UK

The BGM121/BGM123 modules have been tested against the relevant harmonized/designated standards and are in conformity with the essential requirements and other relevant requirements of the EU's Radio Equipment Directive (RED) (2014/53/EU) and of the UK's Radio Equipment Regulations (RER) (S.I. 2017/1206).

Please notice that every end-product integrating a BGM121/BGM123 module will need to perform the radio EMC tests on the whole assembly, according to the ETSI 301 489-x relevant standards.

Furthermore, it is ultimately the responsibility of the manufacturers to ensure the compliance of their end-products as a whole. The specific product assembly is likely to have an impact to RF radiated characteristics, when compared to the bare module. Hence, manufacturers should carefully consider RF radiated testing with the final product assembly, especially taking into account the gain of the external antenna if any, and the possible deviations in the PSD, EIRP and spurious emissions measurements, as defined in the ETSI EN 300 328 standard.

The modules are entitled to carry the CE and UKCA Marks, and a formal Declaration of Conformity (DoC) is available at the product web page which is reachable starting from https://www.silabs.com/.

11.3 FCC

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- This device may not cause harmful interference, and
- This device must accept any interference received, including interference that may cause undesirable operation.

Any changes or modifications not expressly approved by Silicon Labs could void the user's authority to operate the equipment.

FCC RF Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance. This transmitter meets both portable and mobile limits as demonstrated in the RF Exposure Analysis and SAR test report. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with FCC multi-transmitter product procedures.

OEM Responsibilities to comply with FCC Regulations:

The transmitter module must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with FCC multi-transmitter product procedures.

Each new host will require reassessment of radiated spurious emissions and a permissive change to the certification.

For BGM121N the minimum separation distance to human body is 6 mm. If the separation distance from the antenna to human body is 6 mm or more, SAR testing is not needed. In case the separation distance to human body is less than 6 mm, then OEM integrator is responsible to test the SAR with the end product assembly.

OEM integrator is responsible for testing their end-product for any additional compliance requirements required with this module installed (for example, digital device emissions, PC peripheral requirements, etc.).

Important Note:

In the event that this condition cannot be met (for certain configurations or co-location with another transmitter), then the FCC authorization is no longer considered valid and the FCC ID cannot be used on the final product. In these circumstances, the OEM integrator will be responsible for re-evaluating the end product (including the transmitter) and obtaining a separate FCC authorization.

End Product Labeling

The BGM121/BGM123 Bluetooth module is labeled with its own FCC ID. If the FCC ID is not visible when the module is installed inside another device, then the outside of the device into which the module is installed must also display a label referring to the enclosed module. In that case, the final end product must be labeled in a visible area with the following:

"Contains Transmitter Module FCC ID: QOQBGM12LMA"

Or

"Contains FCC ID: QOQBGM12LMA"

The OEM integrator must not provide information to the end user regarding how to install or remove this RF module or change RF related parameters in the user manual of the end product.

11.4 ISED Canada

ISED Canada (English)

This radio transmitter has been approved by Industry Canada to operate with its embedded antenna. Other antenna types are strictly prohibited for use with this device. This device complies with Industry Canada's license-exempt RSS standards. Operation is subject to the following two conditions:

1. This device may not cause interference; and
2. This device must accept any interference, including interference that may cause undesired operation of the device.

RF Exposure Statement

Exception from routine SAR evaluation limits are given in RSS-102 Issue5. BGM121N meets the given requirements when the minimum separation distance to human body is less than equal to 15 mm. RF exposure or SAR evaluation is not required when the separation distance is 15 mm or more.

BGM121A and BGM123A modules has been tested for worst case RF exposure. As demonstrated in the SAR test report, BGM121A and BGM123A can be mounted in touch with human body without further SAR evaluation.

If the separation distance of BGM121N or BGM123N is less than 15 mm the OEM integrator is responsible for evaluating the SAR.

OEM Responsibilities to comply with IC Regulations

The transmitter module must not be co-located or operating in conjunction with any other antenna or transmitter.

Radiated emission must be tested with each new host product and ISEDC must be notified with a Class 4 Permissive Change.

OEM integrator is responsible for testing their end-product for any additional compliance requirements required with this module installed (for example, digital device emissions, PC peripheral requirements, etc.).

Important note

In the event that these conditions cannot be met (for certain configurations or co-location with another transmitter), then the IC authorization is no longer considered valid and the IC ID cannot be used on the final product. In these circumstances, the OEM integrator will be responsible for re-evaluating the end product (including the transmitter) and obtaining a separate IC authorization.

End Product Labeling

The BGM121/BGM123 module is not labeled with IC ID because of its small physical size. The final end product must be labeled in a visible area with the following:

"**Contains Transmitter Module IC: 5123A-BGM12LMA** "

or

"**Contains IC: 5123A-BGM12LMA"**

The OEM integrator has to be aware not to provide information to the end user regarding how to install or remove this RF module or change RF related parameters in the user manual of the end product.

ISED Canada (Français)

Cet émetteur radio (IC : 5123A-BGM12LMA) a reçu l'approbation d'Industrie Canada pour une exploitation avec l'antenne puce incorporée. Il est strictement interdit d'utiliser d'autres types d'antenne avec cet appareil.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes:

1. L'appareil ne doit pas produire de brouillage; et
2. L'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible de provoquer un fonctionnement non désiré de l'appareil.

Déclaration relative à l'exposition aux radiofréquences (RF)

Les limites applicables à l'exemption de l'évaluation courante du DAS sont énoncées dans le CNR 102, 5e édition. Le module Bluetooth BGM121/BGM123 répond aux exigences données quand la distance de séparation minimum par rapport au corps humain est de 15 mm. L'évaluation de l'exposition aux RF ou du DAS n'est pas requise quand la distance de séparation est de 15 mm ou plus. Si la distance de séparation est inférieure à 15 mm, il incombe à l'intégrateur FEO d'évaluer le DAS.

Responsabilités du FEO ayant trait à la conformité avec les règlements IC

Le Module Bluetooth BGM121/BGM123 a été certifié pour une intégration dans des produits uniquement par les intégrateurs FEO dans les conditions suivantes:

- La ou les antennes doivent être installées de telle façon qu'une distance de séparation minimum de 15 mm soit maintenue entre le radiateur (antenne) et toute personne à tout moment.
- Le module émetteur ne doit pas être installé au même endroit ou fonctionner conjointement avec toute autre antenne ou émetteur.

Dès lors que les deux conditions ci-dessus sont respectées, aucun test supplémentaire de l’émetteur n’est obligatoire. Cependant, il incombe toujours à l'intégrateur FEO de tester la conformité de son produit final vis-à-vis de toute exigence supplémentaire requise avec ce module installé (par exemple, émissions de dispositifs numériques, exigences relatives aux matériels périphériques PC, etc).

Note: S'il s'avère que ces conditions ne peuvent être respectées (pour certaines configurations ou la colocation avec un autre émetteur), alors l'autorisation IC n'est plus considérée comme valide et l'identifiant IC ne peut plus être employé sur le produit final. Dans ces circonstances, l'intégrateur FEO aura la responsabilité de réévaluer le produit final (y compris l'émetteur) et d'obtenir une autorisation IC distincte.

Étiquetage du produit final

L'étiquette du Module BGM121/BGM123 porte son propre identifiant IC. Si l'identifiant IC n'est pas visible quand le module est installé à l'intérieur d'un autre appareil, alors l'extérieur de l'appareil dans lequel le module est installé doit aussi porter une étiquette faisant référence au module qu'il contient. Dans ce cas, une étiquette comportant les informations suivantes doit être apposée sur une partie visible du produit final.

"Contient le module émetteur IC: 5123A-BGM12LMA"

ou

"Contient IC : 5123A-BGM12LMA"

L'intégrateur FEO doit être conscient de ne pas fournir d'informations à l'utilisateur final permettant d'installer ou de retirer ce module RF ou de changer les paramètres liés aux RF dans le mode d'emploi du produit final.

11.5 Japan

The BGM121/BGM123 is certified in Japan with certification number 209-J00226.

Important

The module does is not labeled with Japan certification mark and ID because of the small physical size. Manufacturer who integrates a radio module in their host equipment must place the certification mark and certification number on the outside of the host equipment.

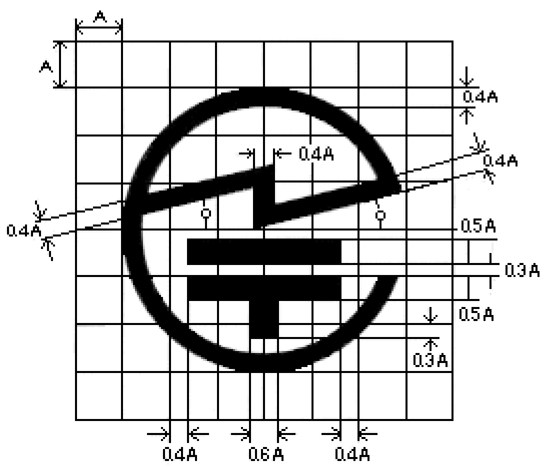
R 209-J00226

The certification mark and certification number must be placed close to the text in the Japanese language which is provided below.

当該機器には電波法に基づく、技術基準適合証明等を受けた特定無線設備を装着している。

Translation:

“This equipment contains specified radio equipment that has been certified to the Technical Regulation Conformity Certification under the Radio Law.”



11.6 Approved Antenna Types

BGM121N and BGM123N modules are approved with a standard 2.14 dBi dipole antenna. Any antenna of the same type, similar in-band out of band characteristics and with the same or less gain can be used without reassessment. In case using antenna of a different type and/or higher gain reassessments and notification to the particular certification authority is required.

12. Revision History

Revision 1.5

October, 2022

- In the front page block diagram, updated the lowest energy mode for LETIMER.
- Updated 3.6.3 Low Energy Timer (LETIMER) lowest energy mode.
- Removed BIASPROG = 1, FULLBIAS = 0 specifications from 4.1.15 Analog Comparator (ACMP).
- Added timing specifications for RESETn low time and clarified V_{IL} and V_{IH} logic levels for RESETn pins in Table 4.20 GPIO on page 31.
- Added Figure 4.2 SPI Master Timing Diagram (SMSDELAY = 1) on page 43.
- Added a note about V_1V8 pin to 5.1 Typical Connections.
- Added reference to AN1223 and updated 10.1 Soldering Recommendations section.
- Added reference to AN1048 in 11. Certifications section.
- Updated 11.2 CE and UKCA - EU and UK.
- Removed all references to RFSENSE.

Revision 1.4

September 2019

- Added the SoC Family in the front page description.
- Updated Supported Protocol to Bluetooth® Low Energy in 1. Feature List.
- Updated the Protocol Stack in Table 2.1 Ordering Information on page 3 to Bluetooth® Low Energy.
- Replaced Bluetooth® Smart with Bluetooth® Low Energy wherever applicable.
- Removed Wake On Radio references wherever applicable since this feature is not supported by the software.
- Corrected the $RSSI_{MIN}$ and $RSSI_{MAX}$ specifications in 4.1.8.3 RF Receiver Characteristics for Bluetooth Low Energy in the 2.4 GHz Band.
- Corrected the Max value of Gain error in ADC in Table 4.22 ADC on page 33.
- Corrected the footprint in Figure 6.2 BGM121/BGM123 PCB Middle and Bottom Layer Design on page 47.
- Updated Figure 7.2 BGM121/BGM123 APORT on page 71 to clarify the APORT Connection Diagram.
- Divided the APORT table into individual tables based on Analog Peripherals in 7.3 Analog Port (APORT).
- Removed Note #5 in Table 8.1 Package Dimensions on page 75 since shield is not used in BGM12x.
- Updated Figure 8.3 Module Footprint on page 78 and Table 8.3 PCB Land Pattern Dimensions on page 78.
- Added a Note in Table 8.3 PCB Land Pattern Dimensions on page 78 regarding the differences in dimensions between the PCB Land Pattern (LPD) and Package Outline Drawing (POD).
- Added a Note in Table 8.3 PCB Land Pattern Dimensions on page 78 with general guidelines for users.
- Added a legend to and updated the Example Stencil Design in Figure 8.4 BGM121/BGM123 Recommended Land Pattern on page 80
- Corrected minor typos wherever applicable throughout the document.

Revision 1.3

- Package dimensions diagram updated
- b and L dimensions adjusted in the PCB land pattern dimensions
- Maximum TX power for BGM123 is amended to +2 dBm, was +3 dBm in earlier data sheet revisions
- Maximum TX power for BGM121 is +8 dBm as in earlier data sheet versions
- Table 4.7 Current consumption in transmit mode: +3 dBm output power changed to +2 dBm

Revision 1.2

- Alternate functionality overview table - the following pins missing were added into table:
  - Certifications listed on front page
  - Bluetooth 4.2 compliant changed to Bluetooth 4.2 low energy compliant on front page
  - + symbol added to top row Typ value in table 4.11
  - Typical schematics section updated
  - PCB Layout recommendations sectionupdated
  - Package Specifications section revised
  - ISEDC changed to ISED Canada

Revision 1.1

- Alternate functionality overview table - the following pins missing were added into table:
  - PA2 / PA3 / PA4 / PA5
  - PC6 / PC7 / PC8 / PC9
  - PF4 / PF5 / PF6 / PF7
- Alternate functionality overview table - LEU0_TX row added.
- Alternate functionality overview table - layout within cells in the table modified.
- Feature list updated

Revision 1.0

- Chapter 4.1.8.1 RF Transmitter General Characteristics for the 2.4 GHz Band updated
- ISEDC description added in French
- BGM121/BGM123 Module Dimensions and Footprint chapter removed

Revision 0.85

- Package marking updated

Revision 0.84

- Package marking updated

Revision 0.83

- Minor updates

Revision 0.82

- Updated electrical characteristics
- Updated package dimensions
- Updated footprint

Revision 0.81

- Layout guidelines updated
- Reference schematics added
- Tape and Reel specifications added

Revision 0.80

- Soldering recommendatoions added
- EM4 shutoff maximum current updated
- Radion patterns added
- Package marking added

Revision 0.79

- Electrical characterisitics updated

Revision 0.78

- Name of datasheet changed from "BGM12 Datasheet" to "BGM121/BGM123 Datasheet"
- Port D9 / Pin 7 marked as "Reserved".
- Number of GPIO pins reduced from 32 to 29.
- Number of pins connected to Analog Port reduced from 32 to 29.
- Ordering info for full production part numbers included.

Revision 0.77

- Power, Ground, Debug, Host UART, SPI, I2C Connections figure updated.

Revision 0.76

- GPIO pin data updated
- Module pinout corrected (V_1V8 and V_BATT exchanged)
- PB14 and PB15 marked DNC (Do Not Connect)

Revision 0.75

- OPN table updated
- Max TX power updated

Revision 0.74

- Land pattern added

Revision 0.73

- Updated pin definitions
- Updated pinout

Revision 0.72

- Updated pin definitions
- Updated package specifications
- Added SPI reference schematic
- Updated layout guidelines

Revision 0.71

- Updated electrical characteristics

Revision 0.70

- Initial draft
