## List of Figures

This user guide supports four applications for the FHR1200. It should be used in conjunction with the FHR1200 datasheet as well as Fairchild's application notes and technical support team. Please visit Fairchild's website at [www.fairchildsemi.com.](file:///C:/WIP/FEBS/FEBFHR1200_SPG01A/www.fairchildsemi.com)

## <span id="page-3-0"></span>1. Introduction

This document describes four proposed applications for the FHR1200 high-performance shunt regulator. These include:

- A. Two each SC70-to-DIP adapters: The small size of the SC70 can make it difficult to solder to the part for prototyping. Each adapter is supplied with a FHR1200 already soldered down.
- B. A 3.3 V-to-12 V regulated energy-storage-capacitor charger. Some smart meters only consume around 250 mW 99% of the time so can use a single 3.3 V low-power offline supply. However, to transmit, they require much higher power for a few milliseconds and can pull this voltage from a storage capacitor charged to a higher voltage.
- C. Voltage regulator and reference: This module can be used with most power supply topologies and on isolated, non-isolated, primary-side, and floating applications.
- D. Low-cost, low-voltage auxiliary regulator: Some designs need a regulated voltage in the 0 to 6 V range at just a few milliamps. The FHR1200 makes it possible to create a lowcost regulator for this application and can operate with an input voltage to >100 V.
- E. Simple  $V_{CC}$  or brownout regulator: Many power supply designs require that the  $V_{CC}$ voltage be regulated for the controller. The low operating current, high voltage and wide temperature range make the FHR1200 a good choice for general regulation applications.

This document contains a general description of the FHR1200, the specifications for each application circuit, schematics, bill of materials, and the typical operating characteristics.

### <span id="page-3-1"></span>1.1. Description

The FHR1200 is a high-efficiency regulator that outperforms a typical shunt regulator in applications where low operating power, wide temperature range, and wide voltage range are important. The regulator also features better stability and faster response than many existing regulators.

The FHR1200 can be used for isolated and non-isolated secondary side regulation plus, primary side, and floating regulation because the regulator can directly drive a power supply controller. This reduces parts count and circuit complexity in many applications. Non-isolated secondary-side regulation saves the cost of OPTOs and simplifies the power supply design.

The FHR1200 can be used in many diverse applications. For example:  $V_{CC}$  regulators to >100 V, small additional auxiliary power supplies, programmable precision Zener diodes (both high and low power), plus numerous analog circuits.

The FHR1200 can also be used as a standalone, low-cost, thermally stable,  $\sim$ 7.5 V voltage reference.

### <span id="page-4-0"></span>1.2. Features

- Low Current Operation: <10 µA
- Programmable Output: 7.5 to >100 V
- Fewest External Component Count
- **Temperature Compensated: Typical <50 ppm**
- Low Dynamic Impedance
- Fast Turn-On
- Low Output Noise
- Sink Current Capability:  $10 \mu A$  to  $50 \text{ mA}$
- Reference Voltage Accuracy:  $\pm 2\%$
- Wide Operating Temperature Range: -55 to 150 °C
- Available in the 6-Lead SC70 Package

**Figure 1. Evaluation Board Photograph (Enlarged)** 

<span id="page-4-1"></span>The evaluation board is the size of an average business card, yet consists of six isolated PCB circuits that can make it quicker and easier to evaluate many potential applications. For example, the designer can use the break-away voltage regulator (app #4) to substitute for the existing output regulator on the power supply to evaluate the improvement over a current design; saving the cost and time of a PCB update to evaluate the part.

## <span id="page-9-1"></span><span id="page-9-0"></span>3. Application Circuit Details

## 3.1. Application #3: Energy Storage Capacitor Charger

This circuit is used to charge an energy storage capacitor to 12 V. This voltage was selected based on the requirements of a smart meter customer. Other voltages could have been used by modifying the value of resistor R22. The maximum regulated output voltage is limited by the breakdown voltage of the switch transistor, Q5, and of diodes, U6. Some smart meters only consume around 250 mW, 99% of the time, so can use a single 3.3 V low-power offline supply to maximize overall efficiency. However, to transmit, they require much higher voltage for a few milliseconds. This can be pulled from a storage capacitor charged to a higher voltage. The charger must be very efficient and consume little power once the capacitor is charged to the pre-determined voltage.

The PCB layout allows the circuit to be built two ways. The supplied board uses the BJT, Q4, and the logic inverter, U7. An alternate method using the comparator, U8, would have a lower parts count and improved efficiency, but had not been tested at the time the board was built and verified.

Dual diodes, U6, minimize the output leakage current of the charger to minimize the discharge of the outboard energy storage capacitor. During operation, the circuit charges the energy storage capacitor until the capacitor voltage reaches 12 V. The circuit then starts to pulse very slowly to overcome the circuit leakages.

<span id="page-9-2"></span>**Figure 8. Energy Storage Capacitor, Regulated High-Efficiency Charger** 

**Figure 9. Energy Storage Capacitor Charger, Circuit Operation** 

### <span id="page-10-1"></span><span id="page-10-0"></span>3.2. Application #4: Voltage Regulator & Reference

Application circuit #4 can be used for voltage regulation on many power supply topologies and on isolated, non-isolated, primary side, and floating applications. It can also be used as a 7.5 V thermally stable, wide temperature range, low-current, voltage reference. The small circuit allows it to directly replace existing regulators on power supplies for evaluation. The circuit is arranged to be broken off the main board to facilitate prototyping.

The PCB layout allows the circuit to be built in a variety of ways to facilitate:

- 1. Isolated regulation using one of two possible OPTO isolators. The FOD817D OPTO isolator provides the lowest cost regulation. The H11AG1VM OPTO isolator provides the highest efficiency regulation. H11AG1VM is specified to operate to less than 200 µA, while the FOD817D is specified to operate to a minimum of 1.0 mA.
- 2. Non-isolated operation by removing both OPTOs.
- 3. Grounded-output operation that directly drives a controller to minimize parts count and cost, or to configure the FHR1200 regulator as an LM431-type stacked regulator.
- 4. Isolated output-side regulation. It may also be configured for: non-isolated output-side regulation, primary-side regulation, or floating regulation with a buck regulator.
- 5. Building a thermally compensated, wide input range, voltage reference.

<span id="page-11-1"></span><span id="page-11-0"></span>**Figure 11. Application Circuit #4: Isolated Output, Grounded Output Regulator**

[Table 1](#page-12-0) illustrates how the FHR1200 reference  $V_{BE}$  and  $V_{REF}$  voltages are related at 40  $\mu$ A reference current in the grounded configuration over temperature. At 40  $\mu$ A, the reference is very stable, as shown in [Figure 12.](#page-13-1) [Table 2](#page-13-0) provides additional data for designers to determine the optimum operating currents for a design and gives the optimum value for resistor R4. R4 sets the Zener current in the grounded configuration.

[Figure 12](#page-13-1) illustrates the stability of the FHR1200 reference at  $200 \mu A$  or 1.0 mA collector current and  $40 \mu A$  Zener current in the grounded configuration. The FHR1200 reference voltage is the sum of the Zener voltage plus the base emitter voltage of the BJT, which also serves as the error amplifier. The BJT base-emitter temperature coefficient ("tempco") is approximately  $-2.2$  mV/ $\degree$ C. The Zener was selected to have a tempco that closely matches the BJT base-emitter tempco, but in the opposite direction. Note: Zener temperature coefficients vary widely from one Zener voltage to the next, from manufacture to manufacture, and over applied current. The FHR1200 Zener was selected to provide the most consistent  $V_{BE}$  match over temperature.

[Table 2](#page-13-0) helps determine the optimum resistor values to properly bias the Zener and BJT over temperature. [Table 3](#page-14-0) provides resistor divider values versus output voltage in the Grounded Configuration.

[Table 1-](#page-12-0)[Table 3](#page-14-0) an[d Figure 12](#page-13-1) provide the data to set up the FHR1200 regulator.

## <span id="page-12-0"></span>Table 1.  $V_{BE}$  and  $V_{REF}$  Values at 40  $\mu$ A: Grounded Configuration

**Table 3. Resistor Divider Values vs. Output Voltage: Grounded Configuration**

[Figure 13](#page-14-1) illustrates how Application Circuit #4 can be modified for an LM431-type configuration. This configuration stacks the Zener and the BJT so that the same current that flows through the Zener flows through the base-emitter of the BJT. The circuit uses one less component and can operate at currents below 10 µA.

<span id="page-14-1"></span>

[Table 4](#page-15-0) gives the voltage divider values for different regulator voltages given a 200  $\mu$ A collector current and a 50 µA divider current.

Vout (volts)	Vref (volts)	Idivider (uA)	Icc. (uA)	Ic (uA)	Iref (uA)	Temp 'C	R <sub>1</sub> (K)	R <sub>2</sub> (K)	R <sub>1</sub> 1% Value	R <sub>2</sub> 1% Value

<span id="page-15-0"></span>**Table 4. Resistor Divider Values for Isolated Output Regulator** 

[Figure 14](#page-15-1) shows how application circuit #4 can be used to make a non-isolated output regulator. The grounded configuration is used because the output of the regulator must directly drive a power supply controller to ground on the feedback pin. The values of R1 and R2 were selected for an output voltage of 24 V. R4 was selected to set the Zener current to 25 µA.

[Table 5](#page-16-0) provides the  $V_{BE}$  and  $V_{REF}$  voltage when the Zener current (I<sub>Z</sub>) is set to 25  $\mu$ A and the collector current is set to  $200 \mu A$ . This biasing reduces the regulator power dissipation to 2.4 mW with a 24 V output voltage.

### **FHR1200: Dynamic Impedance vs Frequency**

The dynamic impedance versus frequency is low for the FHR1200 over a large frequency range as can be seen in the graph below. The impedance is a function of current and can be further lowered by raising the current to as much as 50mA.

## <span id="page-21-0"></span>3.3. Application #5: 0 to 6 V Regulator

Application circuit #5 is a  $0 \text{ V}$  to  $6 \text{ V}$ ,  $0 \text{ mA}$  to  $50 \text{ mA}$  voltage regulator made of an FHR1200 and a few resistors. It can be used for voltage regulation where just a few milliamps are needed for an auxiliary circuit, such as a micro-controller. The small size and low-cost of the circuit allows it to be used where space and cost is a consideration.

## <span id="page-28-0"></span>6. Application Circuit Tests

Six application circuits are provided to help designers understand the FHR1200 and how it might be used in an application. The FHR1200 is very flexible and can be used in many diverse applications. Default voltages and operating currents were selected to enable testing, but may require adjustment for a particular application. The design formulas, device curves, and data are supplied in this document and in the FHR1200 datasheet.

**EMICONDUCTOR** 

## **As Originally Built, Application Circuit Tests**

**Figure 34. Energy Capacitor Charger Circuit Operation Description** 

## **As Originally Built, Application Circuit Tests**

#### **Initial Check**

- Set Test DVM to "ohms" on the 10K scale. Place the  $\overline{1}$ red probe to Pin "D" and the black to pin "E"
- Measure the resistance. The resistance should be  $\sigma$  $>10K$  nhms
- Verify that the FHR1200 U1 is installed correctly using the procedure for the Adapter boards.
- Carefully check that all the components are properly installed and soldered

#### **Function Check**

- Connect the positive terminal of a 22 volt supply to Pin "D" of the Application. Connect the negative terminal to pin "E". Turn on the power supply. The<br>current should be <1.5mA.
- 2. Increase the power supply voltage to around 24 volts. The power supply current should be >2.2mA.
- Measure the resistance of "pin "fb" to pin "B". It<br>should be < 400 ohms with the power supply voltage at around 24volts or so.
- 4. Turn off the power supply
- NOTE: Excitation of the OPTO can be checked using a<br>DVM on the resistance scale from "fb" to "B". At 24 volts "D" to "E" and approximately 2.2mA, the OPTO will measure around 370 ohms. At below 0.5mA "D" to "E", the OPTO, "fb" to "B", will be >10K ohms

## <span id="page-32-0"></span>7. Device Characteristic Data

The following section provides characterization data on the FHR1200. Please note that the data was selected to help designers with applications. It is not a complete set of possible curves or tables on the device. If other data is required, please feel free to ask an FAE or sales representative.

- $1.$ Vref reading at 25C given a particular current (Ibias)
- $2.$ The difference between the maximum and minimum values of Vref over the temperature range of interest (Vref (dev). Ibias remains constant over the full temp range.

V<sub>REF</sub>(dev): V<sub>REF</sub> deviation over full temperature range

where AT is the rated operating free-air temperature range of the device.

TCV<sub>RFF</sub> can be positive or negative, depending on whether minimum V<sub>RFF</sub> or maximum V<sub>RFF</sub>, respectively, occurs at the lower temperature.

### **Figure 38. Calculating the FHR1200 Reference Temperature Coefficient**

```
FAIRCHILD
SEMICONDUCTOR
```
## **Reference Temp Stability**

### Output Tempco:

Looking at the graph to the left, the reference voltage will change from  $\sim$  7.34 volts to 7.46 volts over the temperature range of -40 to 125C and 200uA. Vref (25C)= 7.39 volts.

 $= ((7.46 - 7.34)/7.39)/165 =$ 

Reference Tempco: 90 ppm/C

NOTE: At 200uA, the maximum value of Vref occurs at 125C and the minimum value occurs at  $-40C$ .

If Ibias =  $50uA$ ; (max value at  $90C$ )

 $= ((7.36 - 7.305) / 7.34) / 165 =$ 

Reference Tempco: 45.4 ppm/C

NOTE: There will also be an error due to the ref input current variation over temperature.

> Icc is the same as zener current in the Vref431 config

<span id="page-35-1"></span>

#### FAIRCHILD **Ref Input Current Due to hfe Tempco** SEMICONDUCTOR<sup>®</sup>

### **BJT: hfe Graph**

### Ref Input Current:

We have decided to operate the regulator at 250uA. We will allow 50uA for the divider and 200uA for the regulator. The operating temperature range was set to -40 to 125C.

Looking at the graph to the left, the minimum hfe occurs at -40C:  $\sim$ 160.

Since the collector current is 200uA, the base current is therefore: 1.26uA

The maximum hfe occurs at 100C:  $\sim$ 360 and the base current is: 0.556uA

By setting the divider current to 50uA, this minimizes the influence of temperature on the divider error due to base current. On average, the ref input current is approximately 0.77uA at 25C.

### **Figure 44. BJT hfe Variation Over Temperature**

<span id="page-36-0"></span>

## How Low a Current Can it Operate?)

### Answer:

The data indicates that the part is still usable down to 2uA of bias current. However, the change in reference break-over voltage must be accounted for in the calculations.

The data clearly shows operation above 6.3 volts at 2uA for all temperatures. NOTE: While operation at 2uA is possible, the impedances will be very high and will need to be accounted for to ensure proper regulation.

<span id="page-36-1"></span>**Figure 45. Zener Voltage vs. I<sub>z</sub> vs. Temperature** 

#### **FAIRCHILD** How is Zener Tempco Affected Temperature?) **SEMICONDUCTOR**

The data indicates that the part is still usable down below 10uA but the tempeo changes quite a bit below 200uA or so. This is fortunate since the tempco of a BJT B-E junction tends to be around -2.2mV/C over a moderate range of current.

To produce a temperature stable reference, the reference voltage should not vary over temperature. A quick look at the graph indicates that the best zener tempeo is around 20 to 60uA.

NOTE: This data indicates that while operation at 2uA is possible, the overall tempeo of the reference may not be very good. However, it may still be adequate for many applications.

#### **WARNING AND DISCLAIMER**

Replace components on the Evaluation Board only with those parts shown on the parts list (or Bill of Materials) in the Users' Guide. Contact an authorized Fairchild representative with any questions.

This board is intended to be used by certified professionals, in a lab environment, following proper safety procedures. Use at your own risk. The Evaluation board (or kit) is for demonstration purposes only and neither the Board nor this User's Guide constitute a sales contract or create any kind of warranty, whether express or implied, as to the applications or products involved. Fairchild warrantees that its products meet Fairchild's published specifications, but does not guarantee that its products work in any specific application. Fairchild reserves the right to make changes without notice to any products described herein to improve reliability, function, or design. Either the applicable sales contract signed by Fairchild and Buyer or, if no contract exists, Fairchild's standard Terms and Conditions on the back of Fairchild invoices, govern the terms of sale of the products described herein.

#### DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

#### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION.

#### As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
- 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

#### **ANTI-COUNTERFEITING POLICY**

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

#### **EXPORT COMPLIANCE STATEMENT**

These commodities, technology, or software were exported from the United States in accordance with the Export Administration Regulations for the ultimate destination listed on the commercial invoice. Diversion contrary to U.S. law is prohibited.

U.S. origin products and products made with U.S. origin technology are subject to U.S Re-export laws. In the event of re-export, the user will be responsible to ensure the appropriate U.S. export regulations are followed.
