

QUICK START GUIDE FOR DEMONSTRATION CIRCUIT 477

LOW NOISE\EMI SWITCHING POWER SUPPLY

LT1683

DESCRIPTION

Demonstration circuit 477 shows how the LT1683 switching regulator greatly reduces conducted and radiated EMI by controlling the voltage and current slew rates of the two output switches. DC477 employs a push-pull topology which is inherently less noisy than most other topologies and the high frequency EMI is reduced by as much as 40dB by slewing the switching currents and voltages. The design is very well suited for noise sensitive systems such as medical instruments, industrial sensing and control, data conversion and wide band communications.

DC477 can be set up to produce an isolated or non-isolated +5Vout at 2A from a 36Vin – 72Vin range. The Board can be modified, by changing the transformer, to produce multiple output voltages less than or greater than the input voltage. DC477 uses potentiometers that set the slew rates of the power switches, allowing the user to observe the benefit of slew rate control, and to examine the tradeoff between noise performance and circuit efficiency.

Design files for this circuit board are available. Call the LTC factory.

QUICK START PROCEDURE

DC477 is easy to set up to evaluate the performance of the LT1683. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

1. Connect the 0 – 2A load between the Vout and Gnd terminals on the right hand side of the board.
2. Apply 48V between the Vin and Gnd terminals on the left hand side of the board.
3. To measure the output noise connect one end of a BNC cable to the BNC connector J1. Connect the other end of the BNC cable to an oscilloscope with a 50 Ohm input impedance ... refer to Application Note AN70 for more precise techniques for measuring the output noise.

Notes:

1. The temperatures of MOSFETs Q3 and Q4 should be monitored if potentiometers R6 and R9 are adjusted from their factory settings.
2. The board comes set up for a non-isolated Vout. The board can also be set up for an isolated Vout by making the following changes:
Insert R18, R23
Remove R19, R21, R22, C16
 $R10 = 3.9k$
 $R14 = 510 \text{ ohm}$
 $C18 = 1\mu\text{F}$
Insert C20
