All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
 2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other disputes involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawing, chart, program, algorithm, application examples.
 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
 4. You shall not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics products.
 5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (space and undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
 6. When using the Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat radiation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions or failure or accident arising out of the use of Renesas Electronics products beyond such specified ranges.
 7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please ensure to implement safety measures to guard them against the possibility of bodily injury, injury or damage caused by fire, and social damage in the event of failure or malfunction of Renesas Electronics products, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures by your own responsibility as warranty for your products/system. Because the evaluation of microcomputer software alone is very difficult and not practical, please evaluate the safety of the final products or systems manufactured by you.
 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please investigate applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive carefully and sufficiently and use Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
 9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall not use Renesas Electronics products or technologies for (1) any purpose relating to the development, design, manufacture, use, stockpiling, etc., of weapons of mass destruction, such as nuclear weapons, chemical weapons, or biological weapons, or missiles (including unmanned aerial vehicles (UAVs)) for delivering such weapons, (2) any purpose relating to the development, design, manufacture, or use of conventional weapons, or (3) any other purpose of disturbing international peace and security, and you shall not sell, export, lease, transfer, or release Renesas Electronics products or technologies to any third party whether directly or indirectly with knowledge or reason to know that the third party or any other party will engage in the activities described above. When exporting, selling, transferring, etc., Renesas Electronics products or technologies, you shall comply with any applicable export control laws and regulations promulgated and administered by the governments of the countries asserting jurisdiction over the parties or transactions.
 10. Please acknowledge and agree that you shall bear all the losses and damages which are incurred from the misuse or violation of the terms and conditions described in this document, including this notice, and hold Renesas Electronics harmless, if such misuse or violation results from your resale or making Renesas Electronics products available any third party.
 11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual describes the functions and electrical characteristics of the Renesas Synergy™ Microcontroller.

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Synergy Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents for the Renesas Synergy Microcontroller. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document type	Description
Microcontrollers	Datasheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Microcontrollers	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	Datasheet	Functional descriptions and specific performance data for software modules that are included in Renesas Synergy Software Package (SSP)
	User's Manual: Software	API reference including SSP architecture and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
1Fh	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 1Fh. In some cases, a hexadecimal number is shown with the prefix 0x, based on C/C++ formatting.
1234	Decimal number. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
ICU.NMICR.NMIMD	Periods separate a function module symbol (ICU), register symbol (NMICR), and bit field symbol (NMIMD)
ICU.NMICR	A period separates a function module symbol (ICU) and register symbol (NMICR)
NMICR.NMIMD	A period separates a register symbol (NMICR) and bit field symbol (NMIMD)
NFCLKSEL[1:0]	In a register bit name, the bit range enclosed in square brackets indicates the number of bits in the field at this location. In this example, NFCLKSEL[1:0] represents a 2-bit field at the specified location in the NMI Pin Interrupt Control Register (NMICR).

6. Unit Prefix

The following unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Prefix	Description
b	Bit
B	Byte. This unit prefix is generally used for memory specification of the MCU and address space.
k	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms

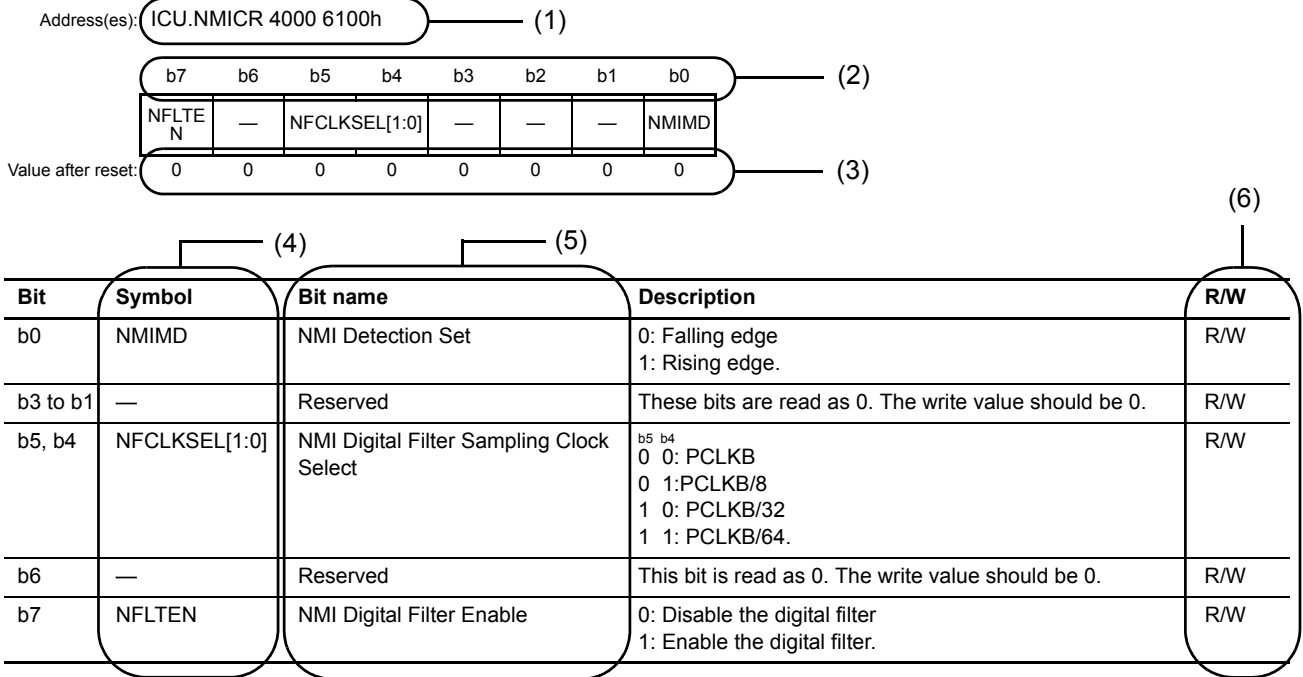

The following terms have special meanings:

Term	Description
NC	Not connected pin. NC means the pin is not connected to the MCU.
Hi-Z	High impedance

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

X.X.X NMI Pin Interrupt Control Register (NMICR)

(1) Function module symbol, register symbol, and address assignment

Function module symbol, register symbol, and address assignment of this register are generally expressed. ICU.NMICR 4000 6100h means NMI Pin Interrupt Control Register (NMICR) of Interrupt Controller Unit (ICU) is assigned to address 4000 6100h.

(2) Bit number

This number indicates the bit number. These bits are shown in order from b31 to b0 for a 32-bit register, from b15 to b0 for a 16-bit register, and from b7 to b0 for an 8-bit register.

(3) Value after reset

This symbol or number indicates the value of each bit after a reset. The value is shown in binary unless specified otherwise.

0: Indicates that the value is 0 after a reset.

1: Indicates that the value is 1 after a reset.

x: Indicates that the value is undefined after a reset.

(4) Bit symbol

Bit symbol indicates the short name of the bit field. Reserved bit is expressed with a —.

(5) Bit name

Bit name indicates the full name of the bit field.

(6) R/W

The R/W column indicates access type: whether the bit field is read or write.

R/W: The bit field is read and write.

R/(W): The bit field is read and write. But writing to this bit field has some limitations. For details on the limitations, see the description or notes of respective registers.

R: The bit field is read-only. Writing to this bit field has no effect.

W: The bit field is write-only. The read value is undefined.

9. Abbreviations

Abbreviations used in this manual are shown in the following table:

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-Performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating-Point Unit
GSM	Global System for Mobile communications
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-On Reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter

High efficiency 48-MHz Arm® Cortex®-M4 core, 1-MB code flash memory, 192-KB SRAM, Segment LCD Controller, Capacitive Touch Sensing Unit, USB 2.0 Full-Speed, 14-Bit A/D Converter, 12-Bit D/A Converter, security and safety features.

Features

■ Arm Cortex-M4 Core with Floating Point Unit (FPU)

- Armv7E-M architecture with DSP instruction set
- Maximum operating frequency: 48 MHz
- Support for 4-GB address space
- Arm Memory Protection Unit (MPU) with 8 regions
- Debug and Trace: ITM, DWT, FPB, TPIU, ETB
- CoreSight™ debug port: JTAG-DP and SW-DP

■ Memory

- 1-MB code flash memory
- 8-KB data flash memory (up to 100000 erase/write cycles)
- 192-KB SRAM
- Flash Cache (FCACHE)
- Memory Protection Units
- Memory Mirror Function
- 128-bit unique ID

■ Connectivity

- USB 2.0 Full-Speed Module (USBFS)
 - On-chip transceiver with voltage regulator
 - Compliant with USB Battery Charging Specification 1.2
- Serial Communications Interface (SCI) × 6
 - UART
 - Simple IIC
 - Simple SPI
- Serial Peripheral Interface (SPI) × 2
- I²C bus interface (IIC) × 3
- CAN module (CAN)
- Serial Sound Interface Enhanced (SSIE)
- SD/MMC Host Interface (SDHI)
- Quad Serial Peripheral Interface (QSPI)
- External address space
 - 8- or 16-bit bus space is selectable per area

■ Analog

- 14-Bit A/D Converter (ADC14)
- 12-Bit D/A Converter (DAC12)
- 8-Bit D/A Converter (DAC8) × 2 (for ACMPLP)
- Low Power Analog Comparator (ACMPLP) × 2
- Operational Amplifier (OPAMP) × 4
- Temperature Sensor (TSN)

■ Timers

- General PWM Timer 32-Bit (GPT32) × 4
- General PWM Timer 16-Bit (GPT16) × 6
- Asynchronous General-Purpose Timer (AGT) × 2
- Watchdog Timer (WDT)

■ Safety

- ECC in SRAM
- SRAM parity error check
- Flash area protection
- ADC self-diagnosis function
- Clock Frequency Accuracy Measurement Circuit (CAC)
- Cyclic Redundancy Check (CRC) calculator
- Data Operation Circuit (DOC)
- Port Output Enable for GPT (POEG)
- Independent Watchdog Timer (IWDT)
- GPIO readback level detection
- Register write protection
- Main oscillator stop detection
- Illegal memory access

■ System and Power Management

- Low power modes
- Realtime Clock (RTC) with calendar and Battery Backup support
- Event Link Controller (ELC)
- DMA Controller (DMAC) × 4
- Data Transfer Controller (DTC)
- Key Interrupt Function (KINT)
- Power-on reset
- Low voltage detection with voltage settings

■ Security and Encryption

- AES128/256
- GHASH
- True Random Number Generator (TRNG)

■ Human Machine Interface (HMI)

- Segment LCD Controller (SLCDC)
 - Up to 54 segments × 4 commons
 - Up to 50 segments × 8 commons
- Capacitive Touch Sensing Unit (CTSU)

■ Multiple Clock Sources

- Main clock oscillator (MOSC)
 - (1 to 20 MHz when VCC = 2.4 to 5.5 V)
 - (1 to 8 MHz when VCC = 1.8 to 2.4 V)
 - (1 to 4 MHz when VCC = 1.6 to 1.8 V)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO)
 - (24, 32, 48, 64 MHz when VCC = 2.4 to 5.5 V)
 - (24, 32, 48 MHz when VCC = 1.8 to 5.5 V)
 - (24, 32 MHz when VCC = 1.6 to 5.5 V)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- Independent watchdog timer OCO (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- Clock out support

■ General Purpose I/O Ports

- Up to 126 input/output pins
 - Up to 3 CMOS input
 - Up to 123 CMOS input/output
 - Up to 11 input/output 5 V tolerant
 - Up to 2 pins high current (20 mA)

■ Operating Voltage

- VCC: 1.6 to 5.5 V

■ Operating Temperature and Packages

- Ta = -40°C to +85°C
 - 145-pin LGA (7 mm × 7 mm, 0.5 mm pitch)
 - 121-pin BGA (8 mm × 8 mm, 0.65 mm pitch)
 - 100-pin LGA (7 mm × 7 mm, 0.65 mm pitch)
- Ta = -40°C to +105°C
 - 144-pin LQFP (20 mm × 20 mm, 0.5 mm pitch)
 - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)
 - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
 - 64-pin QFN (8 mm × 8 mm, 0.4 mm pitch)

1. Overview

The S3A1 MCU group integrates multiple series of software- and pin-compatible Arm®-based 32-bit MCUs that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

Each MCU provides an optimal combination of low-power, high-performance Arm Cortex®-M4 core running up to 48 MHz, with the following features:

- 1-MB code flash memory
- 192-KB SRAM
- Segment LCD Controller (SLCDC)
- Capacitive Touch Sensing Unit (CTSU)
- USB 2.0 Full-Speed Module (USBFS)
- 14-bit A/D Converter (ADC14)
- 12-bit D/A Converter (DAC12)
- Security features.

Feature	Functional description
Code flash memory	Maximum 1-MB code flash memory. See section 47, Flash Memory in the User's Manual.
Data flash memory	8-KB data flash memory. See section 47, Flash Memory in the User's Manual.
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 7, Option-Setting Memory in the User's Manual.
Memory Mirror Function (MMF)	The MMF can be configured to mirror the target application image load address in code flash memory to the application image link address in the 23-bit unused memory space (memory mirror space addresses). Your application code is developed and linked to run from this MMF destination address. The application code does not need to know the load location where it is stored in code flash memory. See section 5, Memory Mirror Function (MMF) in the User's Manual.
SRAM	On-chip high-speed SRAM providing either parity bit or Error Correction Code (ECC). The first 16 KB in SRAM0 provides error correction capability using ECC. See section 46, SRAM in the User's Manual.

See section 6, Resets in the User's Manual.
Low Voltage Detection (LVD)	Low Voltage Detection (LVD) function monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. See section 8, Low Voltage Detection (LVD) in the User's Manual.
Clocks	<ul style="list-style-type: none"> • Main clock oscillator (MOSC) • Sub-clock oscillator (SOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • PLL frequency synthesizer • Independent watchdog timer on-chip oscillator • Clock out support. See section 9, Clock Generation Circuit in the User's Manual.
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) checks the system clock frequency with a reference clock signal by counting the number of pulses of the system clock to be measured. The reference clock can be provided externally through a CACREF pin or internally from various on-chip oscillators. Event signals can be generated when the clock does not match or measurement ends. This feature is particularly useful in implementing a fail-safe mechanism for home and industrial automation applications. See section 10, Clock Frequency Accuracy Measurement Circuit (CAC) in the User's Manual.
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC/DTC module and DMAC module. The ICU also controls NMI interrupts. See section 14, Interrupt Controller Unit (ICU) in the User's Manual.
Key Interrupt Function (KINT)	A key interrupt can be generated by setting the Key Return Mode Register (KRM) and inputting a rising or falling edge to the key interrupt input pins. See section 21, Key Interrupt Function (KINT) in the User's Manual.
Low power modes	Power consumption can be reduced in multiple ways, such as by setting clock dividers, controlling EBCLK output, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See section 11, Low Power Modes in the User's Manual.
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery powered area includes the RTC, SOSC, LOCO, wakeup control, backup memory, VBATT_R low voltage detection, and switch between VCC and VBATT. During normal operation, the battery powered area is powered by the main power supply, which is the VCC pin. When a VCC voltage drop is detected, the power source is switched to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source is switched from the VBATT pin to the VCC pin. See section 12, Battery Backup Function in the User's Manual.
Register write protection	The register write protection function protects important registers from being overwritten because of software errors. See section 13, Register Write Protection in the User's Manual.

Table 1.3 System (2 of 2)

Feature	Functional description
Memory Protection Unit (MPU)	Four MPUs and a CPU stack pointer monitor function are provided for memory protection. See section 16, Memory Protection Unit (MPU) in the User's Manual.
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down-counter. It can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, a non-maskable interrupt or interrupt can be generated by an underflow. A refresh-permitted period can be set to refresh the counter and used as the condition for detecting when the system runs out of control. See section 26, Watchdog Timer (WDT) in the User's Manual.
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) consists of a 14-bit down-counter that must be serviced periodically to prevent counter underflow. It can be used to reset the MCU or to generate a non-maskable interrupt/interrupt for a timer underflow. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically on a reset, underflow, refresh error, or by a refresh of the count value in the registers. See section 27, Independent Watchdog Timer (IWDT) in the User's Manual.

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals to connect them to different modules, enabling direct interaction between the modules without CPU intervention. See section 19, Event Link Controller (ELC) in the User's Manual.

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 18, Data Transfer Controller (DTC) in the User's Manual.
DMA Controller (DMAC)	A 4-channel DMA Controller (DMAC) module is provided for transferring data without the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 17, DMA Controller (DMAC) in the User's Manual.

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with 4 channels and a 16-bit timer with 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See section 23, General PWM Timer (GPT) in the User's Manual.
Port Output Enable for GPT (POEG)	Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output disable state. See section 22, Port Output Enable for GPT (POEG) in the User's Manual.
Asynchronous General Purpose Timer (AGT)	The Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting of external events. This 16-bit timer consists of a reload register and a down-counter. The reload register and the down-counter are allocated to the same address, and they can be accessed with the AGT register. See section 24, Asynchronous General Purpose Timer (AGT) in the User's Manual.
Realtime Clock (RTC)	The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are controlled by the register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 25, Realtime Clock (RTC) in the User's Manual.

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communication Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> • Asynchronous interfaces (UART and asynchronous communications interface adapter (ACIA)) • 8-bit clock synchronous interface • Simple IIC (master-only) • Simple SPI • Smart card interface. The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCI0 and SCI1 have FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 29, Serial Communications Interface (SCI) in the User's Manual.
I ² C Bus Interface (IIC)	The 3-channel IIC module conforms with and provides a subset of the NXP I ² C bus (Inter-Integrated Circuit bus) interface functions. See section 30, I ² C Bus Interface (IIC) in the User's Manual.
Serial Peripheral Interface (SPI)	Two independent Serial Peripheral Interface (SPI) channels are capable of high-speed, full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 32, Serial Peripheral Interface (SPI) in the User's Manual.
Serial Sound Interface Enhanced (SSIE)	The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting PCM audio data over a serial bus with the MCU. The SSIE supports an audio clock frequency of up to 25 MHz, and can be operated as a slave or master receiver/transmitter/transceiver to suit various applications. The SSIE includes 8-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See section 35, Serial Sound Interface Enhanced (SSIE) in the User's Manual.
Quad Serial Peripheral Interface (QSPI)	The QSPI is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface. See section 33, Quad Serial Peripheral Interface (QSPI) in the User's Manual.

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
Controller Area Network (CAN) Module	The Controller Area Network (CAN) module provides functionality to receive and transmit data using a message-based protocol between multiple slaves and masters in electromagnetically noisy applications. The CAN module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. See section 31, Controller Area Network (CAN) Module in the User's Manual.
USB 2.0 Full-Speed Module (USBFS)	The USBFS is a USB controller that can operate as a host controller or device controller. The module supports full-speed and low-speed (only for the host controller) transfer as defined in the Universal Serial Bus specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in the Universal Serial Bus specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on the your system. The MCU supports revision 1.2 of the Battery Charging specification. Because the MCU can be powered at 5 V, the USB LDO regulator provides the internal USB transceiver power supply at 3.3 V. See section 28, USB 2.0 Full-Speed Module (USBFS) in the User's Manual.
SD/MMC Host Interface (SDHI)	The Secure Digital Host Interface (SDHI) and MultiMediaCard (MMC) interface provide the functionality needed to connect a variety of external memory cards to the MCU. The SDHI supports both 1-bit and 4-bit buses for connecting different memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA). The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and support for high-speed SDR transfer modes. See section 36, SD/MMC Host Interface (SDHI) in the User's Manual.

Table 1.9 Analog

Feature	Functional description
14-bit A/D Converter (ADC14)	A 14-bit successive approximation A/D converter is provided. Up to 28 analog input channels are selectable. Temperature sensor output and internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-bit and 14-bit conversion making it possible to optimize the tradeoff between speed and resolution in generating a digital value. See section 38, 14-Bit A/D Converter (ADC14) in the User's Manual.
12-bit D/A Converter (DAC12)	The 12-bit D/A converts data and includes an output amplifier. See section 39, 12-Bit D/A Converter (DAC12) in the User's Manual.
8-bit D/A Converter (DAC8) (for ACMLP)	The 8-bit D/A converts data and does not include an output amplifier (DAC8). The DAC8 is used only as the reference voltage for ACMLP. See section 43, 8-Bit D/A Converter (DAC8) in the User's Manual.
Temperature Sensor (TSN)	The on-chip temperature sensor determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is linear. The output voltage is provided to the ADC14 for conversion and can be further used by the end application. See section 40, Temperature Sensor (TSN) in the User's Manual.
Low-Power Analog Comparator (ACMLP)	The analog comparator compares the reference input voltage and analog input voltage. The comparison result can be read through software and also be output externally. The reference input voltage can be selected from an input to the CMPREFi (i = 0, 1) pin, an internal 8-bit D/A converter output, or the internal reference voltage (Vref) generated internally in the MCU. The ACMLP response speed can be set before starting an operation. Setting the High-speed mode decreases the response delay time, but increases current consumption. Setting the Low-speed mode increases the response delay time, but decreases current consumption. See section 42, Low Power Analog Comparator (ACMLP) in the User's Manual.
Operational Amplifier (OPAMP)	The operational amplifier amplifies small analog input voltages and outputs the amplified voltages. A total of four differential operational amplifier units with two input pins and one output pin are provided. See section 41, Operational Amplifier (OPAMP) in the User's Manual.

Feature	Functional description
Segment LCD Controller (SLCDC)	<p>The SLCDC provides the following functions:</p> <ul style="list-style-type: none"> • Waveform A or B selectable • The LCD driver voltage generator can switch between an internal voltage boosting method, a capacitor split method, and an external resistance division method • Automatic output of segment and common signals based on automatic display data register read • The reference voltage generated when operating the voltage boost circuit can be selected in 16 steps (contrast adjustment) • The LCD can be made to blink. <p>See section 48, Segment LCD Controller (SLCDC) in the User's Manual.</p>
Capacitive Touch Sensing Unit (CTSU)	<p>The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software, which enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical insulator so that fingers do not come into direct contact with the electrodes. See section 44, Capacitive Touch Sensing Unit (CTSU) in the User's Manual.</p>

Table 1.11 Data processing

Feature	Functional description
Cyclic Redundancy Check (CRC) Calculator	<p>The CRC calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generating polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 34, Cyclic Redundancy Check (CRC) Calculator in the User's Manual.</p>
Data Operation Circuit (DOC)	<p>The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. See section 45, Data Operation Circuit (DOC) in the User's Manual.</p>

1.5 Pin Functions

Function	Signal	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1- μ F capacitor. The capacitor should be placed close to the pin.
	VCL	Input	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VSS	Input	Ground pin. Connect to the system power supply (0 V).
	VBATT	Input	Backup power pin
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN.
	XCOUT	Output	
	EBCLK	Output	Outputs the external bus clock for external devices
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pins for setting the operating mode. The signal levels on these pins must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQ0 to IRQ15	Input	Maskable interrupt request pins
KINT	KR00 to KR07	Input	A key interrupt can be generated by inputting a falling edge to the key interrupt input pins
On-chip debug	TMS	I/O	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
	SWO	Output	Serial wire trace output pin
External bus interface	RD	Output	Strobe signal indicating that reading from the external bus interface space is in progress, active-low
	WR	Output	Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low
	WR0, WR1	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08) is valid in writing to the external bus interface space, in byte strobe mode, active-low
	BC0, BC1	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08) is valid in access to the external bus interface space, in 1-write strobe mode, active-low
	ALE	Output	Address latch signal when address/data multiplexed bus is selected
	WAIT	Input	Input pin for wait request signals in access to the external space, active-low
	CS0 to CS3	Output	Select signals for CS areas, active-low
	A00 to A23	Output	Address bus
	D00 to D15	I/O	Data bus
Battery backup	VBATWIO0 to VBATWIO2	I/O	Output wakeup signal for the VBATT wakeup control function. External event input for the VBATT wakeup control function.

Function	Signal	I/O	Description
GPT	GTETRGA, GTETRGB	Input	External trigger input pin
	GTIOC0A to GTIOC9A, GTIOC0B to GTIOC9B	I/O	Input capture, Output capture, or PWM output pin
	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V phase)
	GTOWUP	Output	3-phase PWM output for BLDC motor control (positive W phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W phase)
AGT	AGTEE0, AGTEE1	Input	External event input enable
	AGTIO0, AGTIO1	I/O	External event input and pulse output
	AGTO0, AGTO1	Output	Pulse output
	AGTOA0, AGTOA1	Output	Output compare match A output
	AGTOB0, AGTOB1	Output	Output compare match B output
RTC	RTCOUT	Output	Output pin for 1-Hz/64-Hz clock
	RTCIC0 to RTCIC2	Input	Time capture event input pins
SCI	SCK0 to SCK4, SCK9	I/O	Input/output pins for the clock (clock synchronous mode)
	RXD0 to RXD4, RXD9	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXD0 to TXD4, TXD9	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTS0_RTS0 to CTS4_RTS4, CTS9_RTS9	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low
	SCL0 to SCL4, SCL9	I/O	Input/output pins for the I ² C clock (simple IIC)
	SDA0 to SDA4, SDA9	I/O	Input/output pins for the I ² C data (simple IIC)
	SCK0 to SCK4, SCK9	I/O	Input/output pins for the clock (simple SPI)
	MISO0 to MISO4, MISO9	I/O	Input/output pins for slave transmission of data (simple SPI)
	MOSI0 to MOSI4, MOSI9	I/O	Input/output pins for master transmission of data (simple SPI)
	SS0 to SS4, SS9	Input	Slave-select input pins (simple SPI), active-low
IIC	SCL0 to SCL2	I/O	Input/output pins for clock
	SDA0 to SDA2	I/O	Input/output pins for data
SSIE	SSIBCK0	I/O	SSIE serial bit clock pin
	SSILRCK0/SSIFS0	I/O	Word select pins
	SSITXD0	Output	Serial data output pins
	SSIRXD0	Input	Serial data input pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input/output pins for data output from the master
	MISOA, MISOB	I/O	Input/output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input/output pins for slave selection
	SSLA1, SSLA2, SSLA3, SSLB1, SSLB2, SSLB3	Output	Output pins for slave selection

Function	Signal	I/O	Description
QSPI	QSPCLK	Output	QSPI clock output pin
	QSSL	Output	QSPI slave output pin
	QIO0	I/O	Master transmit data/data 0
	QIO1	I/O	Master input data/data 1
	QIO2, QIO3	I/O	Data 2, Data 3
CAN	CRX0	Input	Receive data
	CTX0	Output	Transmit data
USBFS	VSS_USB	Input	Ground pins
	VCC_USB_LDO	Input	Power supply pin for USB LDO regulator
	VCC_USB	I/O	Input: Power supply pin for USB transceiver. Output: USB LDO regulator output pin. This pin should be connected to an external capacitor.
	USB_DP	I/O	D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.
	USB_DM	I/O	D- I/O pin of the USB on-chip transceiver. This pin should be connected to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. This pin should be connected to VBUS on the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a device controller.
	USB_EXICEN	Output	Low power control signal for external power supply (OTG) chip
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA, USB_OVRCURB	Input	Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
USB_ID	Input	Connect the MicroAB connector ID input signal to this pin during operation in OTG mode	
SDHI	SD0CLK	Output	SD clock output pin
	SD0CMD	I/O	SD command output, response input signal pin
	SD0DAT0 to SD0DAT7	I/O	SD data bus pins
	SD0CD	Input	SD card detection pin
	SD0WP	Input	SD write-protect signal
Analog power supply	AVCC0	Input	Analog voltage supply pin
	AVSS0	Input	Analog voltage supply ground pin
	VREFH0	Input	Analog reference voltage supply pin
	VREFL0	Input	Reference power supply ground pin
	VREFH	Input	Analog reference voltage supply pin for D/A converter
	VREFL	Input	Analog reference ground pin for D/A converter
ADC14	AN000 to AN027	Input	Input pins for the analog signals to be processed by the A/D converter
	ADTRG0	Input	Input pins for the external trigger signals that start the A/D conversion, active-low
DAC12	DA0	Output	Output pins for the analog signals to be processed by the D/A converter
Comparator output	VCOUT	Output	Comparator output pin
ACMPLP	CMPREF0, CMPREF1	Input	Reference voltage input pins
	CMPIN0, CMPIN1	Input	Analog voltage input pins
OPAMP	AMP0+ to AMP3+	Input	Analog voltage input pins
	AMP0- to AMP3-	Input	Analog voltage input pins
	AMP00 to AMP30	Output	Analog voltage output pins
CTSU	TS00 to TS13, TS17 to TS22, TS27 to TS31, TS34, TS35	Input	Capacitive touch detection pins (touch pins)
	TSCAP	—	Secondary power supply pin for the touch driver

Function	Signal	I/O	Description
I/O ports	P000 to P015	I/O	General-purpose input/output pins
	P100 to P115	I/O	General-purpose input/output pins

2. Electrical Characteristics

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

$VCC^{*1} = AVCC0 = VCC_USB^{*2} = VCC_USB_LDO^{*2} = 1.6$ to 5.5 V, $V_{RERH} = V_{REFH0} = 1.6$ to $AVCC0$, $V_{BATT} = 1.6$ to 3.6 V, $V_{SS} = AVSS0 = V_{REFL} = \bar{V}_{REFL0} = V_{SS_USB} = 0$ V, $T_a = T_{opr}$

Note 1. The typical condition is set to $VCC = 3.3$ V.

Note 2. When USBFS is not used.

Figure 2.1 shows the timing conditions.

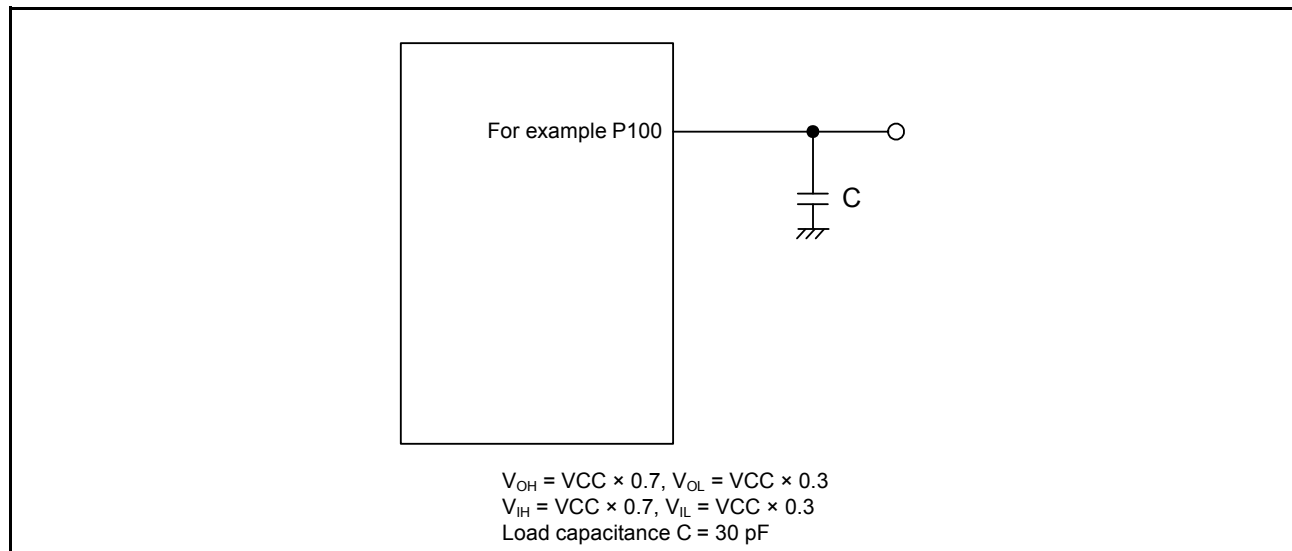

Figure 2.1 Input or output timing measurement conditions

The measurement conditions of timing specifications in each peripheral are recommended for the best peripheral operation. However, make sure to adjust driving abilities of each pin to meet your conditions.

Each function pin used for the same function must select the same drive ability. If the I/O drive ability of each function pin is mixed, the AC specification of each function is not guaranteed.

2.1 Absolute Maximum Ratings

Table 2.1 Absolute maximum ratings

Parameter	Symbol	Value	Unit
Power supply voltage	VCC	-0.5 to +6.5	V
Input voltage	5V-tolerant ports*1	V_{in}	-0.3 to +6.5

Analog input voltage	When AN000 to AN015 are used	V_{AN}	-0.3 to AVCC0 + 0.3
	When AN016 to AN027 are used		-0.3 to VCC + 0.3
LCD voltage	VL1 voltage	V_{L1}	-0.3 to +2.8
	VL2 voltage	V_{L2}	-0.3 to +6.5
	VL3 voltage	V_{L3}	-0.3 to +6.5
	VL4 voltage	V_{L4}	-0.3 to +6.5
Operating temperature*2, *3, *4	T_{opr}	-40 to +105	°C
		-40 to +85	
Storage temperature	T_{stg}	-55 to +125	°C

Note 1. Ports P205, P206, P400 to P404, P407, P408, P511, P512 are 5V-tolerant.

Note 2. See [section 2.2.1, Tj/Ta Definition](#).

Note 3. Contact Renesas Electronics sales office for information on derating operation under $T_a = +85^{\circ}\text{C}$ to $+105^{\circ}\text{C}$. Derating is the systematic reduction of load for improved reliability.

Note 4. The upper limit of operating temperature is 85°C or 105°C , depending on the product. For details, see [section 1.3, Part Numbering](#).

Caution: Permanent damage to the MCU may result if absolute maximum ratings are exceeded.

To preclude any malfunctions due to noise interference, insert capacitors with high frequency characteristics between the VCC and VSS pins, between the AVCC0 and AVSS0 pins, between the VCC_USB and VSS_USB pins, between the VREFH0 and VREFL0 pins, and between the VREFH and VREFL pins. Place capacitors of about 0.1 μF as close as possible to every power supply pin and use the shortest and heaviest possible traces. Also, connect capacitors as stabilization capacitance.

Connect the VCL pin to a VSS pin by a 4.7 μF capacitor. The capacitor must be placed close to the pin.

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up might cause malfunction and the abnormal current that passes in the device at this time might cause degradation of internal elements.

Table 2.2 Recommended operating conditions

	VREFL0		-	0	-	V
	VREFH	When used as DAC12 Reference	1.6	-	AVCC0	V
	VREFL		-	0	-	V

Note 1. Use AVCC0 and VCC under the following conditions:

AVCC0 and VCC can be set individually within the operating range when $VCC \geq 2.2\text{ V}$ and $AVCC0 \geq 2.2\text{ V}$

$AVCC0 = VCC$ when $VCC < 2.2\text{ V}$ or $AVCC0 < 2.2\text{ V}$.

Note 2. When powering on the VCC and AVCC0 pins, power them on at the same time or the VCC pin first and then the AVCC0 pin.

2.2 DC Characteristics

2.2.1 T_j/T_a Definition

Table 2.3 DC characteristics

 Conditions: Products with operating temperature (T_a) -40 to +105°C

Parameter	Symbol	Typ	Max	Unit	Test conditions
Permissible junction temperature	T _j	-	125	°C	High-speed mode Middle-speed mode Low-voltage mode Low-speed mode Subosc-speed mode
			105*1		

Note: Make sure that $T_j = T_a + \theta_{ja} \times \text{total power consumption (W)}$, where total power consumption = $(V_{CC} - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CCmax} \times V_{CC}$.

Note 1. The upper limit of operating temperature is 85°C or 105°C, depending on the product. For details, see [section 1.3, Part Numbering](#). If the part number shows the operation temperature at 85°C, then the maximum value of T_j is 105°C, otherwise, it is 125°C.

Table 2.16 Rising and falling gradient and ripple frequency characteristics

Conditions: VCC = AVCC0 = VCC_USB = 1.6 to 5.5 V

The ripple voltage must meet the allowable ripple frequency $f_{r(VCC)}$ within the range between the VCC upper limit (5.5 V) and lower limit (1.6 V).

When VCC change exceeds VCC \pm 10%, the allowable voltage change rising/falling gradient dt/dVCC must be met.

Note 1. Time until the clock can be used after the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is set to 0 (operating) when the external clock is stable.

Note 2. The VCC range that the PLL can be used is 2.4 to 5.5 V.

Note 3. After changing the setting of the SOSCCR.SOSTP bit so that the sub-clock oscillator operates, only start using the sub-clock oscillator after the sub-clock oscillation stabilization wait time elapsed. Use the oscillator wait time recommended by the oscillator manufacturer.

Note 4. The 48-MHz HOCO can be used within a VCC range of 1.8 V to 5.5 V.

Note 5. The 64-MHz HOCO can be used within a VCC range of 2.4 V to 5.5 V.

Note 6. This is a characteristic when HOCOCCR.HCSTP bit is set to 0 (oscillation) in MOCO stop state.

When HOCOCCR.HCSTP bit is set to 0 (oscillation) during MOCO oscillation, this specification is shortened by 1 μs.

Note 7. Whether stabilization time has elapsed can be confirmed by OCSF.HOCOSF.

Note 8. This is a characteristic when PLLCR.PLLSTP bit is set to 0 (operation) in MOCO stop state.

When PLLCR.PLLSTP bit is set to 0 (operation) during MOCO oscillation, this specification is shortened by 1 μs.

Note 9. When setting up the main clock, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended stabilization time. After changing the setting of the MOSCCR.MOSTP bit so that the main clock oscillator operates, read the OCSF.MOSCSF flag to confirm that it is 1, then start using the main clock.

Figure 2.82 Illustration of 14-bit A/D converter characteristic terms

Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as the analog input voltage. For example, if 12-bit resolution is used and the reference voltage $V_{REFH0} = 3.072$ V, then 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If analog input voltage is 6 mV, an absolute accuracy of ± 5 LSB means that the actual A/D conversion result is in the range of 003h to 00Dh, though an output code of 008h can be expected from the theoretical A/D conversion characteristics.

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB width based on the ideal A/D conversion characteristics and the width of the actually output code.

Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

Figure 2.83 Illustration of D/A converter characteristic terms

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal output voltage based on the ideal conversion characteristic when the measured offset and full-scale errors are zeroed, and the actual output voltage.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB voltage width based on the ideal D/A conversion characteristics and the width of the actual output voltage.

Offset error

Offset error is the difference between the highest actual output voltage that falls below the lower output limit and the ideal output voltage based on the input code.

Full-scale error

Full-scale error is the difference between the lowest actual output voltage that exceeds the upper output limit and the ideal output voltage based on the input code.

Note 1. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 1000), erasing can be done n times for each block. For instance, when 8-byte programming is performed 256 times for different addresses in 2-KB blocks, and the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address for several times as one erasure is not enabled (overwriting is prohibited).

Suspended time during erasing		t _{DSED}	-	-	23.0	-	-	21.7	μs
Data flash STOP recovery time		t _{DSTOP}	720	-	-	720	-	-	ns

Note: Does not include the time until each operation of the flash memory is started after instructions are executed by software.

Note: The lower-limit frequency of FCLK is 1 MHz during programming or erasing the flash memory. When using FCLK at below 4 MHz, the frequency can be set to 1 MHz, 2 MHz, or 3 MHz. A non-integer frequency such as 1.5 MHz cannot be set.

Note: The frequency accuracy of FCLK must be ±3.5%. Confirm the frequency accuracy of the clock source.
