

Features

- Best acceleration sensitivity of 0.1 ppb/g
- Any frequencies between 115.2 MHz and 137 MHz accurate to 6 decimal points
- 100% pin-to-pin drop-in replacement to quartz-based XO
- Excellent total frequency stability as low as ± 20 ppm
- Industry best G-sensitivity of 0.1 PPB/G
- LVCMOS/LVTTL compatible output
- AEC-Q100 qualified
- 5-pin SOT23-5 package: 2.9 x 2.8 mm x mm
- RoHS and REACH compliant, Pb-free, Halogen-free and Antimony-free
- [Contact SiTime](#) for up-screening and LAT programs

Applications

- Avionics systems
- Field communication systems
- Telemetry applications

Figure 1. Pin Assignments

Notes:

- A capacitor of value 0.1 μF or higher between Vdd and GND is required.
- In OE or ST mode, a pull-up resistor of 10 kΩ or less is recommended if pin 3 is not externally driven. If pin 3 needs to be left floating, use the NC option.

Table 3. Absolute Maximum Limits

Attempted operation outside the absolute maximum ratings may cause permanent damage to the part. Actual performance of the IC is only guaranteed within the operational specifications, not at absolute maximum ratings.

| Parameter | Min. | Max. | Unit |

Programmable Drive Strength

The SiT2045 includes a programmable drive strength feature to provide a simple, flexible tool to optimize the clock rise/fall time for specific applications. Benefits from the programmable drive strength feature are:

- Improves system radiated electromagnetic interference (EMI) by slowing down the clock rise/fall time.
- Improves the downstream clock receiver’s (RX) jitter by decreasing (speeding up) the clock rise/fall time.
- Ability to drive large capacitive loads while maintaining full swing with sharp edge rates.

For more detailed information about rise/fall time control and drive strength selection, see the [SiTime Application Notes](#) section.

EMI Reduction by Slowing Rise/Fall Time

Figure 15 shows the harmonic power reduction as the rise/fall times are increased (slowed down). The rise/fall times are expressed as a ratio of the clock period. For the ratio of 0.05, the signal is very close to a square wave. For the ratio of 0.45, the rise/fall times are very close to near-triangular waveform. These results, for example, show that the 11th clock harmonic can be reduced by 35 dB if the rise/fall edge is increased from 5% of the period to 45% of the period.

Figure 15. Harmonic EMI reduction as a Function of Slower Rise/Fall Time

Jitter Reduction with Faster Rise/Fall Time

Power supply noise can be a source of jitter for the downstream chipset. One way to reduce this jitter is to speed up the rise/fall time of the input clock. Some chipsets may also require faster rise/fall time in order to reduce their sensitivity to this type of jitter. Refer to the [Rise/Fall Time Tables](#) (Table 7 to Table 11) to determine the proper drive strength.

High Output Load Capability

The rise/fall time of the input clock varies as a function of the actual capacitive load the clock drives. At any given drive strength, the rise/fall time becomes slower as the output load increases. As an example, for a 3.3V SiT2045 device with default drive strength setting, the typical rise/fall time is 0.46 ns for 5 pF output load. The typical rise/fall time slows down to 1 ns when the output load increases to 15 pF. One can choose to speed up the rise/fall time to 0.72 ns by then increasing the driven strength setting on the SiT2045 to “F”.

The SiT2045 can support up to 30 pF in maximum capacitive loads with up to 3 additional drive strength settings. Refer to the [Rise/Fall Time Tables](#) (Table 7 to 11) to determine the proper drive strength for the desired combination of output load vs. rise/fall time.

SiT2045 Drive Strength Selection

Tables 7 through 11 define the rise/fall time for a given capacitive load and supply voltage.

- Select the table that matches the SiT2045 nominal supply voltage (1.8 V, 2.5 V, 2.8 V, 3.0 V, 3.3 V).
- Select the capacitive load column that matches the application requirement (5 pF to 30 pF)
- Under the capacitive load column, select the desired rise/fall times.
- The left-most column represents the part number code for the corresponding drive strength.
- Add the drive strength code to the part number for ordering purposes.

Calculating Maximum Frequency

Based on the rise and fall time data given in Tables 7 through 11, the maximum frequency the oscillator can operate with guaranteed full swing of the output voltage over temperature as follows:

$$\text{Max Frequency} = \frac{1}{5 \times \text{Trf}_{20/80}}$$

where Trf_{20/80} is the typical value for 20%-80% rise/fall time.

Example 1

Calculate f_{MAX} for the following condition:

- Vdd = 3.3 V (Table 11)
- Capacitive Load: 30 pF
- Desired Tr/f time = 1.46 ns (rise/fall time part number code = U)

Part number for the above example:

SiT2045BME12-18EA137.000000

Drive strength code is inserted here. Default setting is “-”

Pin 1 Configuration Options (OE or NC)

Pin 1 of the SiT2045 can be factory-programmed to support two modes: Output Enable (OE) or No Connect (NC). These modes can also be programmed with the Time Machine II using Field Programmable Oscillators.

Output Enable (OE) Mode

In the OE mode, applying logic low to the OE pin only disables the output driver and puts it in Hi-Z mode. The core of the device continues to operate normally. Power consumption is reduced due to the inactivity of the output. When the OE pin is pulled High, the output is typically enabled in $<1\mu\text{s}$.

No Connect (NC) Mode

In the NC mode, the device always operates in its normal mode and outputs the specified frequency regardless of the logic level on pin 1.

Table 12 below summarizes the key relevant parameters in the operation of the device in OE or NC mode.

Table 12. OE vs. NC

| | OE | NC |
|------------------------------------|--------|------|
| Active current 125 MHz (max, 1.8V) | 6 mA | 6 mA |
| OE disable current (max, 1.8V) | 4 mA | N/A |
| OE enable time at 110 MHz (max) | 130 ns | N/A |
| Output driver in OE disable | High Z | N/A |

Output on Startup and Resume

The SiT2045 comes with gated output. Its clock output is accurate to the rated frequency stability within the first pulse from initial device startup.

In addition, the SiT2045 supports “no runt” pulses and “no glitch” output during startup or when the output driver is reenabled from the OE disable mode as shown in the waveform captures in Figure 16 and Figure 17.

Ordering Information

The following part number guide is for reference only. To customize and build an exact part number, use the SiTime [Part Number Generator](#).

SiT2045BM-S2-18EA125.123456D

Note:

13. The voltage portion of the SiT2045 part number consists of two characters that denote the specific supply voltage of the device. The SiT2045 supports either 1.8V ±10% or any voltage between 2.25V and 3.62V. In the 1.8V mode, one can simply insert 18 in the part number. In the 2.5V to 3.3V mode, two digits such as 18, 25 or 33 can be used in the part number to reflect the desired voltage. Alternatively, "XX" can be used to indicate the entire operating voltage range from 2.25V to 3.63V.
