

32-bit ARM Cortex-M0 microcontroller; up to 32 kB flash; up to 10 kB SRAM and 4 kB EEPROM; USB device; USART

Rev. 2.3 — 27 March 2014

**Product data sheet** 

# 1. General description

The LPC11U2x are an ARM Cortex-M0 based, low-cost 32-bit MCU family, designed for 8/16-bit microcontroller applications, offering performance, low power, simple instruction set and memory addressing together with reduced code size compared to existing 8/16-bit architectures.

The LPC11U2x operate at CPU frequencies of up to 50 MHz.

Equipped with a highly flexible and configurable Full-Speed USB 2.0 device controller, the LPC11U2x brings unparalleled design flexibility and seamless integration to today's demanding connectivity solutions.

The peripheral complement of the LPC11U2x includes up to 32 kB of flash memory, up to 10 kB of SRAM data memory and 4 kB EEPROM, one Fast-mode Plus I<sup>2</sup>C-bus interface, one RS-485/EIA-485 USART with support for synchronous mode and smart card interface, two SSP interfaces, four general-purpose counter/timers, a 10-bit ADC (Analog-to-Digital Converter), and up to 54 general-purpose I/O pins.

For additional documentation related to the LPC11U2x parts, see <u>Section 15</u> "References".

# 2. Features and benefits

- System:
  - ARM Cortex-M0 processor, running at frequencies of up to 50 MHz.
  - ARM Cortex-M0 built-in Nested Vectored Interrupt Controller (NVIC).
  - Non-Maskable Interrupt (NMI) input selectable from several input sources.
  - System tick timer.
- Memory:
  - Up to 32 kB on-chip flash program memory.
  - Up to 4 kB on-chip EEPROM data memory; byte erasable and byte programmable.
  - Up to 10 kB SRAM data memory.
  - 16 kB boot ROM.
  - In-System Programming (ISP) and In-Application Programming (IAP) for flash and EEPROM via on-chip bootloader software.
  - ROM-based USB drivers. Flash updates via USB supported.
  - ROM-based 32-bit integer division routines.
- Debug options:

- Standard JTAG (Joint Test Action Group) test interface for BSDL (Boundary Scan Description Language).
- Serial Wire Debug.
- Digital peripherals:
  - Up to 54 General-Purpose I/O (GPIO) pins with configurable pull-up/pull-down resistors, repeater mode, and open-drain mode.
  - Up to 8 GPIO pins can be selected as edge and level sensitive interrupt sources.
  - Two GPIO grouped interrupt modules enable an interrupt based on a programmable pattern of input states of a group of GPIO pins.
  - ◆ High-current source output driver (20 mA) on one pin.
  - High-current sink driver (20 mA) on true open-drain pins.
  - Four general-purpose counter/timers with a total of up to 5 capture inputs and 13 match outputs.
  - Programmable Windowed WatchDog Timer (WWDT) with a dedicated, internal low-power WatchDog Oscillator (WDO).
- Analog peripherals:
  - 10-bit ADC with input multiplexing among eight pins.
- Serial interfaces:
  - USB 2.0 full-speed device controller.
  - USART (Universal Synchronous Asynchronous Receiver/Transmitter) with fractional baud rate generation, internal FIFO, a full modem control handshake interface, and support for RS-485/9-bit mode and synchronous mode. USART supports an asynchronous smart card interface (ISO 7816-3).
  - Two SSP (Synchronous Serial Port) controllers with FIFO and multi-protocol capabilities.
  - I<sup>2</sup>C-bus interface supporting the full I<sup>2</sup>C-bus specification and Fast-mode Plus with a data rate of up to 1 Mbit/s with multiple address recognition and monitor mode.
- Clock generation:
  - Crystal Oscillator with an operating range of 1 MHz to 25 MHz (system oscillator).
  - 12 MHz high-frequency Internal RC oscillator (IRC) that can optionally be used as a system clock.
  - Internal low-power, low-frequency WatchDog Oscillator (WDO) with programmable frequency output.
  - PLL allows CPU operation up to the maximum CPU rate with the system oscillator or the IRC as clock sources.
  - A second, dedicated PLL is provided for USB.
  - Clock output function with divider that can reflect the crystal oscillator, the main clock, the IRC, or the watchdog oscillator.
- Power control:
  - Integrated PMU (Power Management Unit) to minimize power consumption during Sleep, Deep-sleep, Power-down, and Deep power-down modes.
  - Power profiles residing in boot ROM provide optimized performance and minimized power consumption for any given application through one simple function call.
  - Four reduced power modes: Sleep, Deep-sleep, Power-down, and Deep power-down.
  - Processor wake-up from Deep-sleep and Power-down modes via reset, selectable GPIO pins, watchdog interrupt, or USB port activity.

#### 32-bit ARM Cortex-M0 microcontroller

- Processor wake-up from Deep power-down mode using one special function pin.
- Power-On Reset (POR).
- Brownout detect with four separate thresholds for interrupt and forced reset.
- Unique device serial number for identification.
- Single 3.3 V power supply (1.8 V to 3.6 V).
- Temperature range –40 °C to +85 °C.
- Available as LQFP64, LQFP48, TFBGA48, and HVQFN33 packages.

# 3. Applications

- Consumer peripherals
- Medical
- Industrial control

- Handheld scanners
- USB audio devices

# 4. Ordering information

#### Table 1. Ordering information

| Type number       | Package |  |           |
|-------------------|---------|--|-----------|
|                   | Name    | Description  | Version   |
| LPC11U22FBD48/301 | LQFP48  | plastic low profile quad flat package; 48 leads; body $7 \times 7 \times 1.4$ mm                                 | SOT313-2  |
| LPC11U23FBD48/301 | LQFP48  | plastic low profile quad flat package; 48 leads; body $7 \times 7 \times 1.4$ mm                                 | SOT313-2  |
| LPC11U24FHI33/301 | HVQFN33 | plastic thermal enhanced very thin quad flat package; no leads; 33 terminals; body 5 $\times$ 5 $\times$ 0.85 mm | n/a       |
| LPC11U24FBD48/301 | LQFP48  | plastic low profile quad flat package; 48 leads; body $7 \times 7 \times 1.4$ mm                                 | SOT313-2  |
| LPC11U24FET48/301 | TFBGA48 | plastic thin fine-pitch ball grid array package; 48 balls; body 4.5 $\times$ 4.5 $\times$ 0.7 mm                 | SOT1155-2 |
| LPC11U24FHN33/401 | HVQFN33 | plastic thermal enhanced very thin quad flat package; no leads; 33 terminals; body 7 $\times$ 7 $\times$ 0.85 mm | n/a       |
| LPC11U24FBD48/401 | LQFP48  | plastic low profile quad flat package; 48 leads; body $7 \times 7 \times 1.4$ mm                                 | SOT313-2  |
| LPC11U24FBD64/401 | LQFP64  | plastic low profile quad flat package; 64 leads; body $10 \times 10 \times 1.4$ mm                               | SOT314-2  |

# 6.2 Pin description

<u>Table 3</u> shows all pins and their assigned digital or analog functions in order of the GPIO port number. The default function after reset is listed first. All port pins have internal pull-up resistors enabled after reset except for the true open-drain pins PIO0\_4 and PIO0\_5.

Every port pin has a corresponding IOCON register for programming the digital or analog function, the pull-up/pull-down configuration, the repeater, and the open-drain modes.

The USART, counter/timer, and SSP functions are available on more than one port pin.

| Symbol  | Pin HVQFN33  | Pin TFBGA48 | Pin LQFP48 | Pin LQFP64 |            | Reset<br>state<br>[1]  | Туре | Description  |
|---|--|-------------|------------|------------|------------|--|------|--|
| RESET/PIO0_0                                  | A LOW-going<br>resets the devi<br>take on their d<br>to begin at add<br>debug select i |             |            |            |            | <b>RESET</b> — External reset input with 20 ns glitch filter.<br>A LOW-going pulse as short as 50 ns on this pin<br>resets the device, causing I/O ports and peripherals to<br>take on their default states, and processor execution<br>to begin at address 0. This pin also serves as the<br>debug select input. LOW level selects the JTAG<br>boundary scan. HIGH level selects the ARM SWD<br>debug mode. |      |  |
|   |  |             |            |            |            |  |      | In deep power-down mode, this pin must be pulled<br>HIGH externally. The RESET pin can be left<br>unconnected or be used as a GPIO pin if an external<br>RESET function is not needed and Deep power-down<br>mode is not used. |
|   |  |             |            |            |            | -  | I/O  | PIO0_0 — General purpose digital input/output pin.   |
| PIO0_1/CLKOUT/<br>CT32B0_MAT2/<br>USB_FTOGGLE | 3  | C2          | 4          | 5          | <u>[3]</u> | I; PU  | I/O  | <b>PIO0_1</b> — General purpose digital input/output pin. A LOW level on this pin during reset starts the ISP command handler or the USB device enumeration.   |
|   |  |             |            |            |            | -  | 0    | CLKOUT — Clockout pin.   |
|   |  |             |            |            |            | -  | 0    | CT32B0_MAT2 — Match output 2 for 32-bit timer 0.   |
|   |  |             |            |            |            | -  | 0    | USB_FTOGGLE — USB 1 ms Start-of-Frame signal.  |
| PIO0_2/SSEL0/                                 | 8  | F1          | 10         | 13         | [3]        | I; PU  | I/O  | PIO0_2 — General purpose digital input/output pin.   |
| CT16B0_CAP0                                   |  |             |            |            |            | -  | I/O  | SSEL0 — Slave select for SSP0.   |
|   |  |             |            |            |            | -  | I    | CT16B0_CAP0 — Capture input 0 for 16-bit timer 0.  |
| PIO0_3/USB_VBUS                               | 9  | H2          | 14         | 19         | <u>[3]</u> | I; PU  | I/O  | <b>PIO0_3</b> — General purpose digital input/output pin. A LOW level on this pin during reset starts the ISP command handler. A HIGH level during reset starts the USB device enumeration.                                    |
|   |  |             |            |            |            | -  | I    | <b>USB_VBUS</b> — Monitors the presence of USB bus power.  |
| PIO0_4/SCL                                    | 10   | G3          | 15         | 20         | [4]        | I; IA  | I/O  | <b>PIO0_4</b> — General purpose digital input/output pin (open-drain).   |
|   |  |             |            |            |            | -  | I/O  | <b>SCL</b> — $I^2$ C-bus clock input/output (open-drain).<br>High-current sink only if $I^2$ C Fast-mode Plus is<br>selected in the I/O configuration register.  |

[1] Pin state at reset for default function: I = Input; O = Output; PU = internal pull-up enabled; IA = inactive, no pull-up/down enabled; F = floating; If the pins are not used, tie floating pins to ground or power to minimize power consumption.

[2] 5 V tolerant pad. RESET functionality is not available in Deep power-down mode. Use the WAKEUP pin to reset the chip and wake up from Deep power-down mode. An external pull-up resistor is required on this pin for the Deep power-down mode. See <u>Figure 32</u> for the reset pad configuration.

- [3] 5 V tolerant pad providing digital I/O functions with configurable pull-up/pull-down resistors and configurable hysteresis (see Figure 31).
- [4] I<sup>2</sup>C-bus pin compliant with the I<sup>2</sup>C-bus specification for I<sup>2</sup>C standard mode, I<sup>2</sup>C Fast-mode, and I<sup>2</sup>C Fast-mode Plus. The pin requires an external pull-up to provide output functionality. When power is switched off, this pin is floating and does not disturb the I<sub>2</sub>C lines. Open-drain configuration applies to all functions on this pin.
- [5] 5 V tolerant pad providing digital I/O functions with configurable pull-up/pull-down resistors and configurable hysteresis (see Figure 31); includes high-current output driver.
- [6] 5 V tolerant pad providing digital I/O functions with configurable pull-up/pull-down resistors, configurable hysteresis, and analog input. When configured as a ADC input, digital section of the pad is disabled and the pin is not 5 V tolerant (see <u>Figure 31</u>); includes digital input glitch filter.
- [7] Pad provides USB functions. It is designed in accordance with the USB specification, revision 2.0 (Full-speed and Low-speed mode only). This pad is not 5 V tolerant.
- [8] When the system oscillator is not used, connect XTALIN and XTALOUT as follows: XTALIN can be left floating or can be grounded (grounding is preferred to reduce susceptibility to noise). Leave XTALOUT floating.

# 7. Functional description

## 7.1 On-chip flash programming memory

The LPC11U2x contain 24 kB or 32 kB on-chip flash program memory. The flash can be programmed using In-System Programming (ISP) or In-Application Programming (IAP) via the on-chip boot loader software.

# 7.2 EEPROM

The LPC11U2x contain 1 kB, 2 kB, or 4 kB of on-chip byte-erasable and byte-programmable EEPROM data memory. The EEPROM can be programmed using In-Application Programming (IAP) via the on-chip boot loader software.

### 7.3 SRAM

The LPC11U2x contain a total of 8 kB or 10 kB on-chip static RAM memory.

# 7.4 On-chip ROM

The on-chip ROM contains the boot loader and the following Application Programming Interfaces (APIs):

- In-System Programming (ISP) and In-Application Programming (IAP) support for flash
- IAP support for EEPROM
- USB API
- · Power profiles for configuring power consumption and PLL settings
- 32-bit integer division routines

### 7.5 Memory map

The LPC11U2x incorporates several distinct memory regions, shown in the following figures. <u>Figure 6</u> shows the overall map of the entire address space from the user program viewpoint following reset. The interrupt vector area supports address remapping.

The AHB (Advanced High-performance Bus) peripheral area is 2 MB in size and is divided to allow for up to 128 peripherals. The APB (Advanced Peripheral Bus) peripheral area is 512 kB in size and is divided to allow for up to 32 peripherals. Each peripheral of either type is allocated 16 kB of space. This addressing scheme allows simplifying the address decoding for each peripheral.

## **NXP Semiconductors**

#### 32-bit ARM Cortex-M0 microcontroller

# 7.6 Nested Vectored Interrupt Controller (NVIC)

The Nested Vectored Interrupt Controller (NVIC) is part of the Cortex-M0. The tight coupling to the CPU allows for low interrupt latency and efficient processing of late arriving interrupts.

### 7.6.1 Features

- Controls system exceptions and peripheral interrupts.
- In the LPC11U2x, the NVIC supports 24 vectored interrupts.

- Four programmable interrupt priority levels, with hardware priority level masking.
- Software interrupt generation.

#### 7.6.2 Interrupt sources

Each peripheral device has one interrupt line connected to the NVIC but can have several interrupt flags. Individual interrupt flags can also represent more than one interrupt source.

## 7.7 IOCON block

The IOCON block allows selected pins of the microcontroller to have more than one function. Configuration registers control the multiplexers to allow connection between the pin and the on-chip peripherals.

Connect peripherals to the appropriate pins before activating the peripheral and before enabling any related interrupt. Activity of any enabled peripheral function that is not mapped to a related pin is treated as undefined.

### 7.7.1 Features

- Programmable pull-up, pull-down, or repeater mode.
- All GPIO pins (except PIO0\_4 and PIO0\_5) are pulled up to 3.3 V ( $V_{DD}$  = 3.3 V) if their pull-up resistor is enabled.
- Programmable pseudo open-drain mode.
- Programmable 10 ns glitch filter on pins PIO0\_22, PIO0\_23, and PIO0\_11 to PIO0\_16. The glitch filter is turned on by default.
- Programmable hysteresis.
- Programmable input inverter.

### 7.8 General-Purpose Input/Output GPIO

The GPIO registers control device pin functions that are not connected to a specific peripheral function. Pins can be dynamically configured as inputs or outputs. Multiple outputs can be set or cleared in one write operation.

LPC11U2x use accelerated GPIO functions:

- GPIO registers are a dedicated AHB peripheral so that the fastest possible I/O timing can be achieved.
- Entire port value can be written in one instruction.

Any GPIO pin providing a digital function can be programmed to generate an interrupt on a level, a rising or falling edge, or both.

The GPIO block consists of three parts:

- 1. The GPIO ports.
- 2. The GPIO pin interrupt block to control eight GPIO pins selected as pin interrupts.
- Two GPIO group interrupt blocks to control two combined interrupts from all GPIO pins.

#### 7.8.1 Features

- GPIO pins can be configured as input or output by software.
- All GPIO pins default to inputs with interrupt disabled at reset.
- Pin registers allow pins to be sensed and set individually.
- Up to eight GPIO pins can be selected from all GPIO pins to create an edge- or level-sensitive GPIO interrupt request.
- Any pin or pins in each port can trigger a port interrupt.

#### 7.9 USB interface

The Universal Serial Bus (USB) is a 4-wire bus that supports communication between a host and one or more (up to 127) peripherals. The host controller allocates the USB bandwidth to attached devices through a token-based protocol. The bus supports hot-plugging and dynamic configuration of the devices. The host controller initiates all transactions.

The LPC11U2x USB interface consists of a full-speed device controller with on-chip PHY (PHYsical layer) for device functions.

**Remark:** Configure the LPC11U2x in default power mode with the power profiles before using the USB (see <u>Section 7.17.5.1</u>). Do not use the USB with the part in performance, efficiency, or low-power mode.

#### 7.9.1 Full-speed USB device controller

The device controller enables 12 Mbit/s data exchange with a USB Host controller. It consists of a register interface, serial interface engine, and endpoint buffer memory. The serial interface engine decodes the USB data stream and writes data to the appropriate endpoint buffer. The status of a completed USB transfer or error condition is indicated via status registers. If enabled, an interrupt is generated.

#### 7.9.1.1 Features

- Dedicated USB PLL available.
- Fully compliant with USB 2.0 specification (full speed).
- Supports 10 physical (5 logical) endpoints including one control endpoint.
- Single and double buffering supported.
- Each non-control endpoint supports bulk, interrupt, or isochronous endpoint types.
- Supports wake-up from Deep-sleep mode and Power-down mode on USB activity and remote wake-up.
- Supports SoftConnect.

### 7.10 USART

The LPC11U2x contains one USART.

The USART includes full modem control, support for synchronous mode, and a smart card interface. The RS-485/9-bit mode allows both software address detection and automatic address detection using 9-bit mode.

The USART uses a fractional baud rate generator. Standard baud rates such as 115200 Bd can be achieved with any crystal frequency above 2 MHz.

### 7.10.1 Features

- Maximum USART data bit rate of 3.125 Mbit/s.
- 16 byte receive and transmit FIFOs.
- Register locations conform to 16C550 industry standard.
- Receiver FIFO trigger points at 1 B, 4 B, 8 B, and 14 B.
- Built-in fractional baud rate generator covering wide range of baud rates without a need for external crystals of particular values.
- Fractional divider for baud rate control, auto baud capabilities and FIFO control mechanism that enables software flow control implementation.
- Support for RS-485/9-bit mode.
- Support for modem control.
- Support for synchronous mode.
- Includes smart card interface.

#### 7.11 SSP serial I/O controller

The SSP controllers operate on a SSP, 4-wire SSI, or Microwire bus. It can interact with multiple masters and slaves on the bus. Only a single master and a single slave can communicate on the bus during a given data transfer. The SSP supports full duplex transfers, with frames of 4 bit to 16 bit of data flowing from the master to the slave and from the slave to the master. In practice, often only one of these data flows carries meaningful data.

#### 7.11.1 Features

- Maximum SSP speed of 25 Mbit/s (master) or 4.17 Mbit/s (slave) (in SSP mode)
- Compatible with Motorola SPI (Serial Peripheral Interface), 4-wire Texas Instruments SSI (Serial Synchronous Interface), and National Semiconductor Microwire buses
- · Synchronous serial communication
- Master or slave operation
- 8-frame FIFOs for both transmit and receive
- 4-bit to 16-bit frame

## 7.12 I<sup>2</sup>C-bus serial I/O controller

The LPC11U2x contain one I<sup>2</sup>C-bus controller.

The I<sup>2</sup>C-bus is bidirectional for inter-IC control using only two wires: a Serial CLock line (SCL) and a Serial DAta line (SDA). Each device is recognized by a unique address and can operate as either a receiver-only device (e.g., an LCD driver) or a transmitter with the capability to both receive and send information (such as memory). Transmitters and/or receivers can operate in either master or slave mode, depending on whether the chip has to initiate a data transfer or is only addressed. The I<sup>2</sup>C-bus is a multi-master bus, and more than one bus master connected to the interface can be controlled the bus.

#### 7.12.1 Features

- The I<sup>2</sup>C-interface is an I<sup>2</sup>C-bus compliant interface with open-drain pins. The I<sup>2</sup>C-bus interface supports Fast-mode Plus with bit rates up to 1 Mbit/s.
- Easy to configure as master, slave, or master/slave.
- Programmable clocks allow versatile rate control.
- Bidirectional data transfer between masters and slaves.
- Multi-master bus (no central master).
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus.
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus.
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer.
- The I<sup>2</sup>C-bus can be used for test and diagnostic purposes.
- The I<sup>2</sup>C-bus controller supports multiple address recognition and a bus monitor mode.

## 7.13 10-bit ADC

The LPC11U2x contains one ADC. It is a single 10-bit successive approximation ADC with eight channels.

### 7.13.1 Features

- 10-bit successive approximation ADC.
- Input multiplexing among 8 pins.
- Power-down mode.
- Measurement range 0 V to V<sub>DD</sub>.
- 10-bit conversion time  $\ge$  2.44  $\mu$ s (up to 400 kSamples/s).
- Burst conversion mode for single or multiple inputs.
- Optional conversion on transition of input pin or timer match signal.
- Individual result registers for each ADC channel to reduce interrupt overhead.

### 7.14 General purpose external event counter/timers

The LPC11U2x includes two 32-bit counter/timers and two 16-bit counter/timers. The counter/timer is designed to count cycles of the system derived clock. It can optionally generate interrupts or perform other actions at specified timer values, based on four match registers. Each counter/timer also includes one capture input to trap the timer value when an input signal transitions, optionally generating an interrupt.

### 7.14.1 Features

- A 32-bit/16-bit timer/counter with a programmable 32-bit/16-bit prescaler.
- Counter or timer operation.
- One capture channel per timer, that can take a snapshot of the timer value when an input signal transitions. A capture event can also generate an interrupt.

#### 32-bit ARM Cortex-M0 microcontroller

- Four match registers per timer that allow:
  - Continuous operation with optional interrupt generation on match.
  - Stop timer on match with optional interrupt generation.
  - Reset timer on match with optional interrupt generation.
- Up to four external outputs corresponding to match registers, with the following capabilities:
  - Set LOW on match.
  - Set HIGH on match.
  - Toggle on match.
  - Do nothing on match.
- The timer and prescaler can be configured to be cleared on a designated capture event. This feature permits easy pulse-width measurement by clearing the timer on the leading edge of an input pulse and capturing the timer value on the trailing edge.

### 7.15 System tick timer

The ARM Cortex-M0 includes a system tick timer (SYSTICK) that is intended to generate a dedicated SYSTICK exception at a fixed time interval (typically 10 ms).

## 7.16 Windowed WatchDog Timer (WWDT)

The purpose of the WWDT is to prevent an unresponsive system state. If software fails to update the watchdog within a programmable time window, the watchdog resets the microcontroller

### 7.16.1 Features

- Internally resets chip if not periodically reloaded during the programmable time-out period.
- Optional windowed operation requires reload to occur between a minimum and maximum time period, both programmable.
- Optional warning interrupt can be generated at a programmable time before watchdog time-out.
- Software enables the WWDT, but a hardware reset or a watchdog reset/interrupt is required to disable the WWDT.
- Incorrect feed sequence causes reset or interrupt, if enabled.
- Flag to indicate watchdog reset.
- Programmable 24-bit timer with internal prescaler.
- Selectable time period from  $(T_{cy(WDCLK)} \times 256 \times 4)$  to  $(T_{cy(WDCLK)} \times 2^{24} \times 4)$  in multiples of  $T_{cy(WDCLK)} \times 4$ .
- The Watchdog Clock (WDCLK) source can be selected from the IRC or the dedicated watchdog oscillator (WDO). The clock source selection provides a wide range of potential timing choices of watchdog operation under different power conditions.

## 7.17 Clocking and power control

### 7.17.1 Integrated oscillators

The LPC11U2x include three independent oscillators: the system oscillator, the Internal RC oscillator (IRC), and the watchdog oscillator. Each oscillator can be used for more than one purpose as required in a particular application.

Following reset, the LPC11U2x operates from the internal RC oscillator until software switches to a different clock source. The IRC allows the system to operate without any external crystal and the bootloader code to operate at a known frequency.

See Figure 7 for an overview of the LPC11U2x clock generation.

# LPC11U2x

#### 32-bit ARM Cortex-M0 microcontroller

### 7.17.1.1 Internal RC oscillator

The IRC can be used as the clock source for the WDT, and/or as the clock that drives the system PLL and then the CPU. The nominal IRC frequency is 12 MHz.

Upon power-up, any chip reset, or wake-up from Deep power-down mode, the LPC11U2x use the IRC as the clock source. Software can later switch to one of the other available clock sources.

All information provided in this document is subject to legal disclaimers.

#### 7.17.1.2 System oscillator

The system oscillator can be used as the clock source for the CPU, with or without using the PLL. On the LPC11U2x, use the system oscillator to provide the clock source to USB.

The system oscillator operates at frequencies of 1 MHz to 25 MHz. This frequency can be boosted to a higher frequency, up to the maximum CPU operating frequency, by the system PLL.

#### 7.17.1.3 Watchdog oscillator

The watchdog oscillator can be used as a clock source that directly drives the CPU, the watchdog timer, or the CLKOUT pin. The watchdog oscillator nominal frequency is programmable between 7.8 kHz and 1.7 MHz. The frequency spread over processing and temperature is  $\pm 40$  % (see also Table 13).

#### 7.17.2 System PLL and USB PLL

The LPC11U2x contain a system PLL and a dedicated PLL for generating the 48 MHz USB clock. The system and USB PLLs are identical.

The PLL accepts an input clock frequency in the range of 10 MHz to 25 MHz. The input frequency is multiplied up to a high frequency with a Current Controlled Oscillator (CCO). The multiplier can be an integer value from 1 to 32. The CCO operates in the range of 156 MHz to 320 MHz. To support this frequency range, an additional divider keeps the CCO within its frequency range while the PLL is providing the desired output frequency. The output divider can be set to divide by 2, 4, 8, or 16 to produce the output clock. The PLL output frequency must be lower than 100 MHz. Since the minimum output divider value is 2, it is insured that the PLL output has a 50 % duty cycle. The PLL is turned off and bypassed following a chip reset. Software can enable the PLL later. The program must configure and activate the PLL, wait for the PLL to lock, and then connect to the PLL as a clock source. The PLL settling time is 100  $\mu$ s.

#### 7.17.3 Clock output

The LPC11U2x feature a clock output function that routes the IRC oscillator, the system oscillator, the watchdog oscillator, or the main clock to an output pin.

#### 7.17.4 Wake-up process

The LPC11U2x begin operation by using the 12 MHz IRC oscillator as the clock source at power-up and when awakened from Deep power-down mode. This mechanism allows chip operation to resume quickly. If the application uses the main oscillator or the PLL, software must enable these components and wait for them to stabilize. Only then can the system use the PLL and main oscillator as a clock source.

#### 7.17.5 Power control

The LPC11U2x support various power control features. There are four special modes of processor power reduction: Sleep mode, Deep-sleep mode, Power-down mode, and Deep power-down mode. The CPU clock rate can also be controlled as needed by changing clock sources, reconfiguring PLL values, and/or altering the CPU clock divider value. This power control mechanism allows a trade-off of power versus processing speed based on application requirements. In addition, a register is provided for shutting down the clocks to individual on-chip peripherals. This register allows fine-tuning of power

consumption by eliminating all dynamic power use in any peripherals that are not required for the application. Selected peripherals have their own clock divider which provides even better power control.

#### 7.17.5.1 Power profiles

The power consumption in Active and Sleep modes can be optimized for the application through simple calls to the power profile. The power configuration routine configures the LPC11U2x for one of the following power modes:

- Default mode corresponding to power configuration after reset.
- · CPU performance mode corresponding to optimized processing capability.
- Efficiency mode corresponding to optimized balance of current consumption and CPU performance.
- Low-current mode corresponding to lowest power consumption.

In addition, the power profile includes routines to select the optimal PLL settings for a given system clock and PLL input clock.

**Remark:** When using the USB, configure the LPC11U2x in Default mode.

#### 7.17.5.2 Sleep mode

When Sleep mode is entered, the clock to the core is stopped. Resumption from the Sleep mode does not need any special sequence but re-enabling the clock to the ARM core.

In Sleep mode, execution of instructions is suspended until either a reset or interrupt occurs. Peripheral functions continue operation during Sleep mode and can generate interrupts to cause the processor to resume execution. Sleep mode eliminates dynamic power used by the processor itself, by memory systems and related controllers, and by internal buses.

#### 7.17.5.3 Deep-sleep mode

In Deep-sleep mode, the LPC11U2x is in Sleep-mode and all peripheral clocks and all clock sources are off except for the IRC. The IRC output is disabled unless the IRC is selected as input to the watchdog timer. In addition all analog blocks are shut down and the flash is in stand-by mode. In Deep-sleep mode, the application can keep the watchdog oscillator and the BOD circuit running for self-timed wake-up and BOD protection.

The LPC11U2x can wake up from Deep-sleep mode via reset, selected GPIO pins, a watchdog timer interrupt, or an interrupt generating USB port activity.

Deep-sleep mode saves power and allows for short wake-up times.

#### 7.17.5.4 Power-down mode

In Power-down mode, the LPC11U2x is in Sleep-mode and all peripheral clocks and all clock sources are off except for watchdog oscillator if selected. In addition all analog blocks and the flash are shut down. In Power-down mode, the application can keep the BOD circuit running for BOD protection.

The LPC11U2x can wake up from Power-down mode via reset, selected GPIO pins, a watchdog timer interrupt, or an interrupt generating USB port activity.

Power-down mode reduces power consumption compared to Deep-sleep mode at the expense of longer wake-up times.

#### 7.17.5.5 Deep power-down mode

In Deep power-down mode, power is shut off to the entire chip except for the WAKEUP pin. The LPC11U2x can wake up from Deep power-down mode via the WAKEUP pin.

The LPC11U2x can be prevented from entering Deep power-down mode by setting a lock bit in the PMU block. Locking out Deep power-down mode enables the application to keep the watchdog timer or the BOD running at all times.

When entering Deep power-down mode, an external pull-up resistor is required on the WAKEUP pin to hold it HIGH. Pull the RESET pin HIGH to prevent it from floating while in Deep power-down mode.

### 7.17.6 System control

#### 7.17.6.1 Reset

Reset has four sources on the LPC11U2x: the RESET pin, the Watchdog reset, power-on reset (POR), and the BrownOut Detection (BOD) circuit. The RESET pin is a Schmitt trigger input pin. Assertion of chip reset by any source, once the operating voltage attains a usable level, starts the IRC and initializes the flash controller.

A LOW-going pulse as short as 50 ns resets the part.

When the internal Reset is removed, the processor begins executing at address 0, which is initially the Reset vector mapped from the boot block. At that point, all of the processor and peripheral registers have been initialized to predetermined values.

In Deep power-down mode, an external pull-up resistor is required on the RESET pin.

#### 7.17.6.2 Brownout detection

The LPC11U2x includes four levels for monitoring the voltage on the  $V_{DD}$  pin. If this voltage falls below one of the four selected levels, the BOD asserts an interrupt signal to the NVIC. This signal can be enabled for interrupt in the Interrupt Enable Register in the NVIC to cause a CPU interrupt. Alternatively, software can monitor the signal by reading a dedicated status register. Four additional threshold levels can be selected to cause a forced reset of the chip.

#### 7.17.6.3 Code security (Code Read Protection - CRP)

CRP provides different levels of security in the system so that access to the on-chip flash and use of the Serial Wire Debugger (SWD) and In-System Programming (ISP) can be restricted. Programming a specific pattern into a dedicated flash location invokes CRP. IAP commands are not affected by the CRP.

In addition, ISP entry via the PIO0\_1 pin can be disabled without enabling CRP. For details, see the *LPC11Uxx user manual*.

There are three levels of Code Read Protection:

- 1. CRP1 disables access to the chip via the SWD and allows partial flash update (excluding flash sector 0) using a limited set of the ISP commands. This mode is useful when CRP is required and flash field updates are needed but all sectors cannot be erased.
- 2. CRP2 disables access to the chip via the SWD and only allows full flash erase and update using a reduced set of the ISP commands.
- 3. Running an application with level CRP3 selected, fully disables any access to the chip via the SWD pins and the ISP. This mode effectively disables ISP override using PIO0\_1 pin as well. If necessary, the application must provide a flash update mechanism using IAP calls or using a call to the reinvoke ISP command to enable flash update via the USART.

#### CAUTION

If level three Code Read Protection (CRP3) is selected, no future factory testing can be performed on the device.

In addition to the three CRP levels, sampling of pin PIO0\_1 for valid user code can be disabled. For details, see the *LPC11Uxx user manual*.

### 7.17.6.4 APB interface

The APB peripherals are located on one APB bus.

#### 7.17.6.5 AHBLite

The AHBLite connects the CPU bus of the ARM Cortex-M0 to the flash memory, the main static RAM, and the ROM.

#### 7.17.6.6 External interrupt inputs

All GPIO pins can be level or edge sensitive interrupt inputs.

## 7.18 Emulation and debugging

Debug functions are integrated into the ARM Cortex-M0. Serial wire debug functions are supported in addition to a standard JTAG boundary scan. The ARM Cortex-M0 is configured to support up to four breakpoints and two watch points.

The  $\overrightarrow{\text{RESET}}$  pin selects between the JTAG boundary scan ( $\overrightarrow{\text{RESET}}$  = LOW) and the ARM SWD debug ( $\overrightarrow{\text{RESET}}$  = HIGH). The ARM SWD debug port is disabled while the LPC11U2x is in reset.

To perform boundary scan testing, follow these steps:

- 1. Erase any user code residing in flash.
- 2. Power up the part with the RESET pin pulled HIGH externally.
- 3. Wait for at least 250  $\mu$ s.
- 4. Pull the RESET pin LOW externally.
- 5. Perform boundary scan operations.
- 6. Once the boundary scan operations are completed, assert the TRST pin to enable the SWD debug mode, and release the RESET pin (pull HIGH).

**Remark:** The JTAG interface cannot be used for debug purposes.

# 8. Limiting values

#### Table 4. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).[1]

| Symbol                 | Parameter                               | Conditions   | Min  | Max   | Unit |
|------------------------|---|--|------|-------|------|
| V <sub>DD</sub>        | supply voltage (core and external rail) | [2]  | -0.5 | +4.6  | V    |
| VI                     | input voltage                           | 5 V tolerant digital I/O pins; [5][2] $V_{DD} \ge 1.8 \text{ V}$   | -0.5 | +5.5  | V    |
|                        |   | $V_{DD} = 0 V$   | -0.5 | +3.6  | V    |
|                        |   | 5 V tolerant open-drain pins [2][4]<br>PIO0_4 and PIO0_5           | -0.5 | +5.5  |      |
| V <sub>IA</sub>        | analog input voltage                    | pin configured as analog input [2]                                 | -0.5 | 4.6   | V    |
| I <sub>DD</sub>        | supply current                          | per supply pin   | -    | 100   | mA   |
| I <sub>SS</sub>        | ground current                          | per ground pin   | -    | 100   | mA   |
| I <sub>latch</sub>     | I/O latch-up current                    | $-(0.5V_{DD}) < V_{I} < (1.5V_{DD});$<br>T <sub>j</sub> < 125 °C   | -    | 100   | mA   |
| T <sub>stg</sub>       | storage temperature                     | non-operating [6]  | -65  | +150  | °C   |
| T <sub>j(max)</sub>    | maximum junction<br>temperature         |  | -    | 150   | °C   |
| P <sub>tot(pack)</sub> | total power dissipation (per package)   | based on package heat<br>transfer, not device power<br>consumption | -    | 1.5   | W    |
| V <sub>ESD</sub>       | electrostatic discharge voltage         | human body model; all pins   | -    | +6500 | V    |

[1] The following applies to the limiting values:

a) This product includes circuitry specifically designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying greater than the rated maximum.

 b) Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V<sub>SS</sub> unless otherwise noted.

c) The limiting values are stress ratings only. Operating the part at these values is not recommended, and proper operation is not guaranteed. The conditions for functional operation are specified in <u>Table 5</u>.

- [2] Maximum/minimum voltage above the maximum operating voltage (see <u>Table 5</u>) and below ground that can be applied for a short time (< 10 ms) to a device without leading to irrecoverable failure. Failure includes the loss of reliability and shorter lifetime of the device.
- [3] See <u>Table 6</u> for maximum operating voltage.
- [4] V<sub>DD</sub> present or not present. Compliant with the I<sup>2</sup>C-bus standard. 5.5 V can be applied to this pin when V<sub>DD</sub> is powered down.
- [5] Including voltage on outputs in 3-state mode.
- [6] The maximum non-operating storage temperature is different than the temperature for required shelf life which should be determined based on required shelf lifetime. Please refer to the JEDEC spec (J-STD-033B.1) for further details.
- [7] Human body model: equivalent to discharging a 100 pF capacitor through a 1.5 k $\Omega$  series resistor.

# 9. Static characteristics

#### Table 5. Static characteristics

 $T_{amb} = -40$  °C to +85 °C, unless otherwise specified.

| Symbol           | Parameter                               | Conditions  |                               | Min                | Typ[1] | Max             | Unit |

# Table 5. Static characteristics ... continued

[1] Typical ratings are not guaranteed. The values listed are at room temperature (25 °C), nominal supply voltages.

For USB operation 3.0 V  $\leq$  V\_{DD}  $\leq$  3.6 V. Guaranteed by design. [2]

IRC enabled; system oscillator disabled; system PLL disabled. [3]

I<sub>DD</sub> measurements were performed with all pins configured as GPIO outputs driven LOW and pull-up resistors disabled. [4]

[5] BOD disabled.

- [6] All peripherals disabled in the AHBCLKCTRL register. Peripheral clocks to USART, SSP0/1 disabled in the SYSCON block.
- [7] USB\_DP and USB\_DM pulled LOW externally.
- [8] Low-current mode PWR\_LOW\_CURRENT selected when running the set\_power routine in the power profiles.
- [9] IRC disabled; system oscillator enabled; system PLL enabled.
- [10] WAKEUP pin pulled HIGH externally. An external pull-up resistor is required on the RESET pin for the Deep power-down mode.
- [11] Including voltage on outputs in 3-state mode.
- [12] V<sub>DD</sub> supply voltage must be present.
- [13] 3-state outputs go into 3-state mode in Deep power-down mode.
- [14] Allowed as long as the current limit does not exceed the maximum current allowed by the device.

[15] To V<sub>SS</sub>.

[16] Includes external resistors of 33  $\Omega\pm$  1 % on USB\_DP and USB\_DM.

# Table 6.ADC static characteristics $T_{--} = -40$ °C to $\pm 85$ °C unless otherwise

ified ADC f 0514-0614

[1] The ADC is monotonic, there are no missing codes.

The differential linearity error (E<sub>D</sub>) is the difference between the actual step width and the ideal step width. See Figure 8. [2]

The integral non-linearity (E<sub>L(adj)</sub>) is the peak difference between the center of the steps of the actual and the ideal transfer curve after [3] appropriate adjustment of gain and offset errors. See Figure 8.

The offset error (E<sub>D</sub>) is the absolute difference between the straight line which fits the actual curve and the straight line which fits the [4] ideal curve. See Figure 8.

[5] The gain error (E<sub>G</sub>) is the relative difference in percent between the straight line fitting the actual transfer curve after removing offset error, and the straight line which fits the ideal transfer curve. See Figure 8.

The absolute error (E<sub>T</sub>) is the maximum difference between the center of the steps of the actual transfer curve of the non-calibrated [6] ADC and the ideal transfer curve. See Figure 8.

[7]  $T_{amb} = 25 \text{ °C}$ ; maximum sampling frequency  $f_s = 400 \text{ kSamples/s}$  and analog input capacitance  $C_{ia} = 1 \text{ pF}$ .

[8] Input resistance  $R_i$  depends on the sampling frequency fs:  $R_i = 1 / (f_s \times C_{ia})$ .

[1] Interrupt levels are selected by writing the level value to the BOD control register BODCTRL, see *the* LPC11Uxx user manual.

### 9.2 Power consumption

Power measurements in Active, Sleep, and Deep-sleep modes were performed under the following conditions (see the *LPC11Uxx user manual*):

- Configure all pins as GPIO with pull-up resistor disabled in the IOCON block.
- Configure GPIO pins as outputs using the GPIOnDIR registers.
- Write 0 to all GPIOnDATA registers to drive the outputs LOW.

### 32-bit ARM Cortex-M0 microcontroller

- (1) System oscillator and system PLL disabled; IRC enabled.
- (2) System oscillator and system PLL enabled; IRC disabled.
- Fig 10. Typical supply current versus temperature in Active mode

### 32-bit ARM Cortex-M0 microcontroller

### 32-bit ARM Cortex-M0 microcontroller

### 9.3 Peripheral power consumption

The supply current per peripheral is measured as the difference in supply current between the peripheral block enabled and the peripheral block disabled in the SYSAHBCLKCFG and PDRUNCFG (for analog blocks) registers. All other blocks are disabled in both registers and no code is executed. Measured on a typical sample at  $T_{amb} = 25$  °C. Unless noted otherwise, the system oscillator and PLL are running in both measurements.

The supply currents are shown for system clock frequencies of 12 MHz and 48 MHz.

| Table 8. | Power consumption for individual analog and digital blocks |
|----------|--|
|----------|--|

| Peripheral                             | · · · | upply cu |        | Notes   |

#### Table 9. Flash characteristics

 $T_{amb} = -40$  °C to +85 °C, unless otherwise specified.

| Symbol            | Parameter        | Conditions                                | Min   | Тур    | Max  | Unit   |
|-------------------|------------------|---|-------|--------|------|--------|
| N <sub>endu</sub> | endurance        | [1]                                       | 10000 | 100000 | -    | cycles |
| t <sub>ret</sub>  | retention time   | powered                                   | 10    | -      | -    | years  |
|                   |                  | unpowered                                 | 20    | -      | -    | years  |
| t <sub>er</sub>   | erase time       | sector or multiple<br>consecutive sectors | 95    | 100    | 105  | ms     |
| t <sub>prog</sub> | programming time | [2]                                       | 0.95  | 1      | 1.05 | ms     |

[1] Number of program/erase cycles.

[2] Programming times are given for writing 256 bytes from RAM to the flash. Data must be written to the flash in blocks of 256 bytes.

#### Table 10. EEPROM characteristics

 $T_{amb} = -40 \ ^{\circ}C$  to +85  $\ ^{\circ}C$ ;  $V_{DD} = 2.7 \ V$  to 3.6 V. Based on JEDEC NVM qualification. Failure rate < 10 ppm for parts as specified below.

| Symbol            | Parameter           | Conditions | Min    | Тур     | Max | Unit   |
|-------------------|---------------------|------------|--------|---------|-----|--------|
| N <sub>endu</sub> | endurance           |            | 100000 | 1000000 | -   | cycles |
| t <sub>ret</sub>  | retention time      | powered    | 100    | 200     | -   | years  |
|                   |                     | unpowered  | 150    | 300     | -   | years  |
| t <sub>prog</sub> | programming<br>time | 64 bytes   | -      | 2.9     | -   | ms     |

# 10.2 External clock

#### Table 11. Dynamic characteristic: external clock

 $T_{amb} = -40 \ ^{\circ}C$  to +85  $^{\circ}C$ ;  $V_{DD}$  over specified ranges.<sup>[1]</sup>

| Symbol               | Parameter            | Conditions | Min                             | Typ <sup>[2]</sup> | Max  | Unit |
|----------------------|----------------------|------------|---------------------------------|--------------------|------|------|
| f <sub>osc</sub>     | oscillator frequency |            | 1                               | -                  | 25   | MHz  |
| T <sub>cy(clk)</sub> | clock cycle time     |            | 40                              | -                  | 1000 | ns   |
| t <sub>CHCX</sub>    | clock HIGH time      |            | $T_{cy(clk)} \times 0.4$        | -                  | -    | ns   |
| t <sub>CLCX</sub>    | clock LOW time       |            | $T_{\text{cy(clk)}} \times 0.4$ | -                  | -    | ns   |
| t <sub>CLCH</sub>    | clock rise time      |            | -                               | -                  | 5    | ns   |
| t <sub>CHCL</sub>    | clock fall time      |            | -                               | -                  | 5    | ns   |

[1] Parameters are valid over operating temperature range unless otherwise specified.

[2] Typical ratings are not guaranteed. The values listed are at room temperature (25 °C), nominal supply voltages.

### **10.3 Internal oscillators**

#### Table 12. Dynamic characteristics: IRC

 $T_{amb} = -40 \ ^{\circ}C \ to +85 \ ^{\circ}C; 2.7 \ V \le V_{DD} \le 3.6 \ V^{[1]}.$ 

| Symbol               | Parameter                           | Conditions | Min   | Typ <sup>[2]</sup> | Max   | Unit |
|----------------------|-------------------------------------|------------|-------|--------------------|-------|------|
| f <sub>osc(RC)</sub> | internal RC oscillator<br>frequency | -          | 11.88 | 12                 | 12.12 | MHz  |

[1] Parameters are valid over operating temperature range unless otherwise specified.

[2] Typical ratings are not guaranteed. The values listed are at room temperature (25 °C), nominal supply voltages.

Conditions: Frequency values are typical values. 12 MHz  $\pm$  1 % accuracy is guaranteed for 2.7 V  $\leq$  V<sub>DD</sub>  $\leq$  3.6 V and T<sub>amb</sub> = -40 °C to +85 °C. Variations between parts may cause the IRC to fall outside the 12 MHz  $\pm$  1 % accuracy specification for voltages below 2.7 V.

Fig 22. Internal RC oscillator frequency versus temperature

#### Table 13. Dynamic characteristics: Watchdog oscillator

| Symbol                | Parameter                        | Conditions  |               | Min | Typ[1] | Max | Unit |
|-----------------------|----------------------------------|---|---------------|-----|--------|-----|------|
| f <sub>osc(int)</sub> | internal oscillator<br>frequency | DIVSEL = 0x1F, FREQSEL = 0x1<br>in the WDTOSCCTRL register; | <u>[2][3]</u> | -   | 7.8    | -   | kHz  |
|                       |                                  | DIVSEL = 0x00, FREQSEL = 0xF<br>in the WDTOSCCTRL register  | <u>[2][3]</u> | -   | 1700   | -   | kHz  |

[1] Typical ratings are not guaranteed. The values listed are at nominal supply voltages.

|                     |                              |              | Fast-mode                   | 0                     | -   | μS   |
|                     |                              |              | Fast-mode Plus              | 0                     | -   | μS   |
| t <sub>SU;DAT</sub> | data set-up time             | [9][10]      | Standard-mode               | 250                   | -   | ns   |
|                     |                              |              | Fast-mode                   | 100                   | -   | ns   |
|                     |                              |              | Fast-mode Plus              | 50                    | -   | ns   |

[1] See the I<sup>2</sup>C-bus specification UM10204 for details.

[2] Parameters are valid over operating temperature range unless otherwise specified.

- [3] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the V<sub>IH</sub>(min) of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- [4]  $C_b = total capacitance of one bus line in pF.$
- [5] The maximum t<sub>f</sub> for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time for the SDA output stage t<sub>f</sub> is specified at 250 ns. This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t<sub>f</sub>.
- [6] In Fast-mode Plus, fall time is specified the same for both output stage and bus timing. If series resistors are used, designers should allow for this when considering bus timing.

All information provided in this document is subject to legal disclaimers.

# LPC11U2x

### 32-bit ARM Cortex-M0 microcontroller

- [7] The maximum  $t_{HD;DAT}$  could be 3.45  $\mu$ s and 0.9  $\mu$ s for Standard-mode and Fast-mode but must be less than the maximum of  $t_{VD;DAT}$  or  $t_{VD;ACK}$  by a transition time (see *UM10204*). This maximum must only be met if the device does not stretch the LOW period ( $t_{LOW}$ ) of the SCL signal. If the clock stretches the SCL, the data must be valid by the set-up time before it releases the clock.
- [8] tHD;DAT is the data hold time that is measured from the falling edge of SCL; applies to data in transmission and the acknowledge.
- [9] tSU;DAT is the data set-up time that is measured with respect to the rising edge of SCL; applies to data in transmission and the acknowledge.
- [10] A Fast-mode I<sup>2</sup>C-bus device can be used in a Standard-mode I<sup>2</sup>C-bus system but the requirement  $t_{SU;DAT} = 250$  ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line  $t_{r(max)} + t_{SU;DAT} = 1000 + 250 = 1250$  ns (according to the Standard-mode I<sup>2</sup>C-bus specification) before the SCL line is released. Also the acknowledge timing must meet this set-up time.

| t <sub>DH</sub>       | data hold time         | in SPI mode  | [2]           | 0                           | -   | -                            | ns   |
| t <sub>v(Q)</sub>     | data output valid time | in SPI mode  | [2]           | -                           | -   | 10                           | ns   |
| t <sub>h(Q)</sub>     | data output hold time  | in SPI mode  | [2]           | 0                           | -   | -                            | ns   |
| SPI slave             | (in SPI mode)          |  |               |                             |     | +                            |      |
| T <sub>cy(PCLK)</sub> | PCLK cycle time        |  |               | 20                          | -   | -                            | ns   |
| t <sub>DS</sub>       | data set-up time       | in SPI mode  | [3][4]        | 0                           | -   | -                            | ns   |
| t <sub>DH</sub>       | data hold time         | in SPI mode  | <u>[3][4]</u> | $3 \times T_{cy(PCLK)} + 4$ | -   | -                            | ns   |
| t <sub>v(Q)</sub>     | data output valid time | in SPI mode  | <u>[3][4]</u> | -                           | -   | $3 \times T_{cy(PCLK)} + 11$ | ns   |
| t <sub>h(Q)</sub>     | data output hold time  | in SPI mode  | [3][4]        | -                           | -   | $2 \times T_{cy(PCLK)} + 5$  | ns   |

[1]  $T_{cy(clk)} = (SSPCLKDIV \times (1 + SCR) \times CPSDVSR) / f_{main}$ . The clock cycle time derived from the SPI bit rate  $T_{cy(clk)}$  is a function of the main clock frequency  $f_{main}$ , the SPI peripheral clock divider (SSPCLKDIV), the SPI SCR parameter (specified in the SSP0CR0 register), and the SPI CPSDVSR parameter (specified in the SPI clock prescale register).

[2]  $T_{amb} = -40 \ ^{\circ}C$  to 85  $^{\circ}C$ .

 $[3] \quad T_{cy(clk)} = 12 \times T_{cy(PCLK)}.$ 

[4]  $T_{amb} = 25 \text{ °C}$ ; for normal voltage supply range:  $V_{DD} = 3.3 \text{ V}$ .

# **11. Application information**

#### 11.1 Suggested USB interface solutions

The USB device can be connected to the USB as self-powered device (see Figure 27) or bus-powered device (see Figure 28).

On the LPC11U2x, the PIO0\_3/USB\_VBUS pin is 5 V tolerant only when V<sub>DD</sub> is applied and at operating voltage level. Therefore, if the USB\_VBUS function is connected to the USB connector and the device is self-powered, the USB VBUS pin must be protected for situations when  $V_{DD} = 0$  V.

If V<sub>DD</sub> is always at operating level while VBUS = 5 V, the USB VBUS pin can be connected directly to the VBUS pin on the USB connector.

For systems where V<sub>DD</sub> can be 0 V and VBUS is directly applied to the VBUS pin, precautions must be taken to reduce the voltage to below 3.6 V, which is the maximum allowable voltage on the USB\_VBUS pin in this case.

One method is to use a voltage divider to connect the USB VBUS pin to the VBUS on the USB connector. The voltage divider ratio should be such that the USB VBUS pin will be greater than 0.7V<sub>DD</sub> to indicate a logic HIGH while below the 3.6 V allowable maximum voltage.

For the following operating conditions

VBUS<sub>max</sub> = 5.25 V

 $V_{DD} = 3.6 V,$ 

the voltage divider should provide a reduction of 3.6 V/5.25 V or ~0.686 V.

For a bus-powered device, the VBUS signal does not need to be connected to the USB\_VBUS pin (see Figure 28). The USB\_CONNECT function can additionally be connected as shown in Figure 27 to prevent the USB from timing out when there is a significant delay between power-up and handling USB traffic.

**Remark:** When a bus-powered circuit as shown in <u>Figure 28</u> is used, configure the <u>PIO0\_3/USB\_VBUS</u> pin for GPIO (PIO0\_3) in the IOCON block to ensure that the USB\_CONNECT signal can still be controlled by software. For details on the soft-connect feature, see the *LPC11U2x user manual* (<u>Ref. 1</u>).

**Remark:** When a self-powered circuit is used without connecting VBUS, configure the PIO0\_3/USB\_VBUS pin for GPIO (PIO0\_3) and provide software that can detect the host presence through some other mechanism before enabling USB\_CONNECT and the soft-connect feature. Enabling the soft-connect without host presence will lead to USB compliance failure.

### 11.2 XTAL input

The input voltage to the on-chip oscillators is limited to 1.8 V. If the oscillator is driven by a clock in slave mode, it is recommended that the input be coupled through a capacitor with  $C_i = 100 \text{ pF}$ . To limit the input voltage to the specified range, choose an additional capacitor to ground  $C_g$  which attenuates the input voltage by a factor  $C_i/(C_i + C_g)$ . In slave mode, a minimum of 200 mV (RMS) is needed.

Product data sheet

#### 32-bit ARM Cortex-M0 microcontroller

In slave mode, couple the input clock signal with a capacitor of 100 pF (Figure 29), with an amplitude between 200 mV (RMS) and 1000 mV (RMS). This signal corresponds to a square wave signal with a signal swing of between 280 mV and 1.4 V. The XTALOUT pin in this configuration can be left unconnected.

External components and models used in oscillation mode are shown in Figure 30 and in Table 18 and Table 19. Since the feedback resistance is integrated on chip, only a crystal and the capacitances  $C_{X1}$  and  $C_{X2}$  need to be connected externally in case of fundamental mode oscillation (L,  $C_L$  and  $R_S$  represent the fundamental frequency). Capacitance  $C_P$  in Figure 30 represents the parallel package capacitance and must not be larger than 7 pF. Parameters  $F_{OSC}$ ,  $C_L$ ,  $R_S$  and  $C_P$  are supplied by the crystal manufacturer.

# 11.3 XTAL Printed-Circuit Board (PCB) layout guidelines

Follow these guidelines for PCB layout:

- Connect the crystal on the PCB as close as possible to the oscillator input and output pins of the chip.
- Take care that the load capacitors  $C_{x1}$ ,  $C_{x2}$ , and  $C_{x3}$  in case of third overtone crystal use have a common ground plane.
- Connect the external components to the ground plain.
- To keep parasitics and the noise coupled in via the PCB as small as possible, keep loops as small as possible.
- Choose smaller values of C<sub>x1</sub> and C<sub>x2</sub> if parasitics of the PCB layout increase.

### 32-bit ARM Cortex-M0 microcontroller

# 11.4 Standard I/O pad configuration

Figure 31 shows the possible pin modes for standard I/O pins with analog input function:

- Digital output driver
- Digital input: Pull-up enabled/disabled
- Digital input: Pull-down enabled/disabled
- Digital input: Repeater mode enabled/disabled
- Analog input

32-bit ARM Cortex-M0 microcontroller

# 11.5 Reset pad configuration

# 11.6 ADC effective input impedance

A simplified diagram of the ADC input channels can be used to determine the effective input impedance seen from an external voltage source. See <u>Figure 33</u>.

The effective input impedance,  $R_{in}$ , seen by the external voltage source,  $V_{EXT}$ , is the parallel impedance of ((1/f<sub>s</sub> x C<sub>ia</sub>) + R<sub>mux</sub> + R<sub>sw</sub>) and (1/f<sub>s</sub> x C<sub>io</sub>), and can be calculated using Equation 1 with

fs = sampling frequency

Cia = ADC analog input capacitance

R<sub>mux</sub> = analog mux resistance

R<sub>sw</sub> = switch resistance

Cio = pin capacitance

$$R_{in} = \left(\frac{I}{f_s \times C_{ia}} + R_{mux} + R_{sw}\right) \| \left(\frac{I}{f_s \times C_{io}}\right)$$
(1)

Under nominal operating condition  $V_{DD} = 3.3$  V and with the maximum sampling frequency fs = 400 kHz, the parameters assume the following values:

$$\begin{split} C_{ia} &= 1 \text{ pF (max)} \\ R_{mux} &= 2 \text{ k}\Omega \text{ (max)} \\ R_{sw} &= 1.3 \text{ k}\Omega \text{ (max)} \\ C_{io} &= 7.1 \text{ pF (max)} \end{split}$$

The effective input impedance with these parameters is  $R_{in} = 308 \text{ k}\Omega$ .

### **11.7 ADC usage notes**

The following guidelines show how to increase the performance of the ADC in a noisy environment beyond the ADC specifications listed in <u>Table 6</u>:

- The ADC input trace must be short and as close as possible to the LPC11U2x chip.
- Shield The ADC input traces from fast switching digital signals and noisy power supply lines.
- The ADC and the digital core share the same power supply. Therefore, filter the power supply line adequately.
- To improve the ADC performance in a noisy environment, put the device in Sleep mode during the ADC conversion.

### 17.1 Data sheet status

| Document status[1][2]          | Product status <sup>[3]</sup> | Definition  |
|--------------------------------|-------------------------------|---|
| Objective [short] data sheet   | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet     | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 17.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

# 17.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors products product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <a href="http://www.nxp.com/profile/terms">http://www.nxp.com/profile/terms</a>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

#### 32-bit ARM Cortex-M0 microcontroller

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b)

# **18. Contact information**

whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
