

## **ADC10731/ADC10732/ADC10734/ADC10738 10-Bit Plus Sign Serial I/O A/D Converters with Mux, Sample/Hold and Reference**

Check for Samples: [ADC10731](#), [ADC10732](#), [ADC10734](#), [ADC10738](#)

### **FEATURES**

- 0V to Analog Supply Input Range
- Serial I/O (MICROWIRE Compatible)
- Software or Hardware Power Down
- Analog Input Sample/Hold Function
- Ratiometric or Absolute Voltage Referencing
- No Zero or Full Scale Adjustment Required
- No Missing Codes Over Temperature
- TTL/CMOS Input/Output Compatible

### **APPLICATIONS**

- Medical Instruments
- Portable and Remote Instrumentation
- Test Equipment

### **KEY SPECIFICATIONS**

- Resolution 10 Bits Plus Sign
- Single Supply 5 V
- Power Consumption 37 mW (Max)
- In Power Down Mode 18  $\mu$ W
- Conversion Time 5  $\mu$ s (Max)
- Sampling Rate 74 kHz (Max)
- Band-Gap Reference 2.5V  $\pm$ 2% (Max)

### **DESCRIPTION**

The ADC10731, ADC10732 and ADC10734 are obsolete or on lifetime buy and included for reference only.

This series of CMOS 10-bit plus sign successive approximation A/D converters features versatile analog input multiplexers, sample/hold and a 2.5V band-gap reference. The 1-, 2-, 4-, or 8-channel multiplexers can be software configured for single-ended or differential mode of operation.

An input sample/hold is implemented by a capacitive reference ladder and sampled-data comparator. This allows the analog input to vary during the A/D conversion cycle.

In the differential mode, valid outputs are obtained even when the negative inputs are greater than the positive because of the 10-bit plus sign output data format.

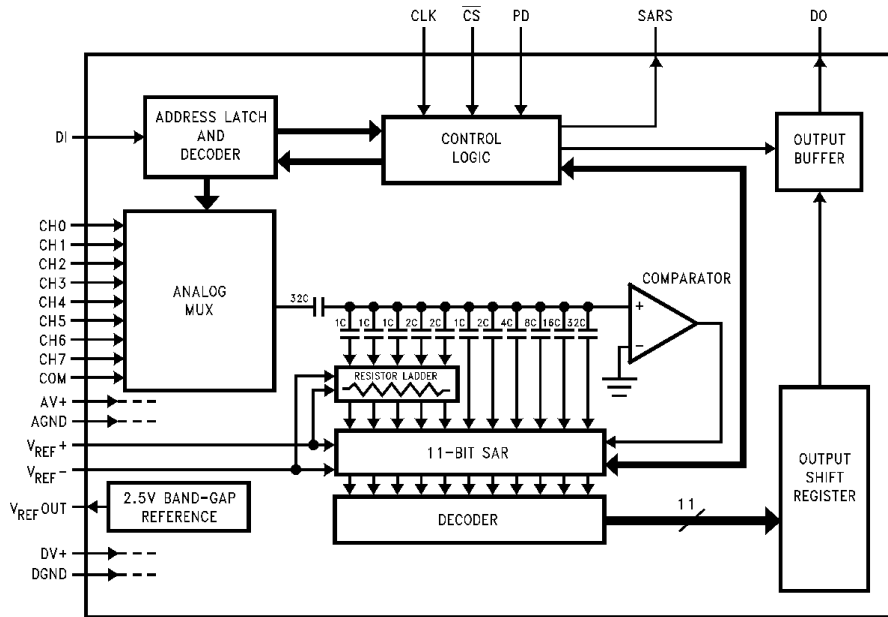

The serial I/O is configured to comply with the MICROWIRE serial data exchange standard for easy interface to the COPS and HPC families of controllers, and can easily interface with standard shift registers and microprocessors.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Table 1. Pin Descriptions

Pin Name	Description
CLK	The clock applied to this input controls the successive approximation conversion time interval, the acquisition time and the rate at which the serial data exchange occurs. The rising edge loads the information on the DI pin into the multiplexer address shift register. This address controls which channel of the analog input multiplexer (MUX) is selected. The falling edge shifts the data resulting from the A/D conversion out on DO. $\overline{CS}$ enables or disables the above functions. The clock frequency applied to this input can be between 5 kHz and 3 MHz
DI	This is the serial data input pin. The data applied to this pin is shifted by CLK into the multiplexer address register. Table 2, Table 3, Table 4 show the multiplexer address assignment.
DO	The data output pin. The A/D conversion result (DB0-SIGN) are clocked out by the falling edge of CLK on this pin.
$\overline{CS}$	This is the chip select input pin. When a logic low is applied to this pin, the rising edge of CLK shifts the data on DI into the address register. This low also brings DO out of TRI-STATE after a conversion has been completed
PD	This is the power down input pin. When a logic high is applied to this pin the A/D is powered down. When a low is applied the A/D is powered up.
SARS	This is the successive approximation register status output pin. When $\overline{CS}$ is high this pin is in TRI-STATE. With $\overline{CS}$ low this pin is active high when a conversion is in progress and active low at all other times.
CH0-CH7	These are the analog inputs of the MUX. A channel input is selected by the address information at the DI pin, which is loaded on the rising edge of CLK into the address register (see Table 2, Table 3, Table 4). The voltage applied to these inputs should not exceed AV <sup>+</sup> or go below GND by more than 50 mV. Exceeding this range on an unselected channel will corrupt the reading of a selected channel.

**Table 1. Pin Descriptions (continued)**

Pin Name	Description
COM	This pin is another analog input pin. It can be used as a “pseudo ground” when the analog multiplexer is single-ended.
V <sub>REF+</sub>	This is the positive analog voltage reference input. In order to maintain accuracy, the voltage range V <sub>REF</sub> (V <sub>REF</sub> = V <sub>REF+</sub> –V <sub>REF-</sub> ) is 0.5 V <sub>DC</sub> to 5.0 V <sub>DC</sub> and the voltage at V <sub>REF+</sub> cannot exceed AV <sup>+</sup> +50 mV.
V <sub>REF-</sub>	The negative voltage reference input. In order to maintain accuracy, the voltage at this pin must not go below GND – 50 mV or exceed AV <sup>+</sup> + 50 mV.
AV <sup>+</sup> , DV <sup>+</sup>	These are the analog and digital power supply pins. These pins should be tied to the same power supply and bypassed separately. The operating voltage range of AV <sup>+</sup> and DV <sup>+</sup> is 4.5 V <sub>DC</sub> to 5.5 V <sub>DC</sub> .
DGND	This is the digital ground pin.
AGND	This is the analog ground pin.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings<sup>(1)(2)(3)</sup>**

Supply Voltage (V <sup>+</sup> = AV <sup>+</sup> = DV <sup>+</sup> )	6.5V		
Total Reference Voltage (V <sub>REF+</sub> –V <sub>REF-</sub> )	6.5V		
Voltage at Inputs and Outputs	V <sup>+</sup> + 0.3V to –0.3V		
Input Current at Any Pin <sup>(4)</sup>	30 mA		
Package Input Current <sup>(4)</sup>	120 mA		
Package Dissipation at T <sub>A</sub> = 25°C <sup>(5)</sup>	500 mW		
ESD Susceptibility <sup>(6)</sup>	Human Body Model	2500V	
	Machine Model	150V	
Soldering Information	N packages (10 seconds)	260°C	
	SOIC Package	Vapor Phase (60 seconds)	215°C
		Infrared (15 seconds)	220°C
Storage Temperature	–40°C to +150°C		

- (1) All voltages are measured with respect to GND, unless otherwise specified.
- (2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) When the input voltage (V<sub>IN</sub>) at any pin exceeds the power supplies (V<sub>IN</sub> < GND or V<sub>IN</sub> > AV<sup>+</sup> or DV<sup>+</sup>), the current at that pin should be limited to 30 mA. The 120 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 30 mA to four.
- (5) The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>Jmax</sub>, θ<sub>JA</sub> and the ambient temperature, T<sub>A</sub>. The maximum allowable power dissipation at any temperature is P<sub>D</sub> = (T<sub>Jmax</sub> – T<sub>A</sub>)/θ<sub>JA</sub> or the number given in the Absolute Maximum Ratings, whichever is lower. For this device, T<sub>Jmax</sub> = 150°C. The typical thermal resistance (θ<sub>JA</sub>) of these Paris when board mounted can be found in the following [Power Dissipation](#) table:
- (6) The human body model is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin. The machine model is a 200 pF capacitor discharged directly into each pin.

**Operating Ratings<sup>(1)(2)</sup>**

Operating Temperature Range	T <sub>MIN</sub> ≤ T <sub>A</sub> ≤ T <sub>MAX</sub>	–40°C ≤ T <sub>A</sub> ≤ +85°C
Supply Voltage (V <sup>+</sup> = AV <sup>+</sup> = DV <sup>+</sup> )		+4.5V to +5.5V
V <sub>REF+</sub>		AV <sup>+</sup> +50 mV to –50 mV
V <sub>REF-</sub>		AV <sup>+</sup> +50 mV to –50 mV
V <sub>REF</sub> (V <sub>REF+</sub> –V <sub>REF-</sub> )		+0.5V to V <sup>+</sup>

- (1) Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics table. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) All voltages are measured with respect to GND, unless otherwise specified.

## Electrical Characteristics

The following specifications apply for  $V^+ = AV^+ = DV^+ = +5.0 V_{DC}$ ,  $V_{REF+} = 2.5 V_{DC}$ ,  $V_{REF-} = GND$ ,  $V_{IN-} = 2.5V$  for Signed Characteristics,  $V_{IN-} = GND$  for Unsigned Characteristics and  $f_{CLK} = 2.5 MHz$  unless otherwise specified. **Boldface limits apply for  $T_A = T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_A = T_J = +25^\circ C$ .** <sup>(1)(2)(3)(4)</sup>

<b>DYNAMIC SIGNED CONVERTER CHARACTERISTICS</b>						
S/(N+D)	Signal-to-Noise Plus Distortion Ratio	$V_{IN} = 4.85 V_{PP}$ , and $f_{IN} = 1 kHz$ to $15 kHz$	67		dB	
ENOB	Effective Number of Bits	$V_{IN} = 4.85 V_{PP}$ , and $f_{IN} = 1 kHz$ to $15 kHz$	10.8		Bits	
THD	Total Harmonic Distortion	$V_{IN} = 4.85 V_{PP}$ , and $f_{IN} = 1 kHz$ to $15 kHz$	-78		dB	
IMD	Intermodulation Distortion	$V_{IN} = 4.85 V_{PP}$ , and $f_{IN} = 1 kHz$ to $15 kHz$	-85		dB	
	Full-Power Bandwidth	$V_{IN} = 4.85 V_{PP}$ , where S/(N + D) Decreases 3 dB	380		kHz	
	Multiplexer Chan to Chan Crosstalk	$f_{IN} = 15 kHz$	-80		dB	

- (1) Two on-chip diodes are tied to each analog input as shown below. They will forward-conduct for analog input voltages one diode drop below ground or one diode drop greater than  $V^+$  supply. Be careful during testing at low  $V^+$  levels (+4.5V), as high level analog inputs (+5V) can cause an input diode to conduct, especially at elevated temperatures, which will cause errors in the conversion result. The specification allows 50 mV forward bias of either diode; this means that as long as the analog  $V_{IN}$  does not exceed the supply voltage by more than 50 mV, the output code will be correct. Exceeding this range on an unselected channel will corrupt the reading of a selected channel. If  $AV^+$  and  $DV^+$  are minimum ( $4.5 V_{DC}$ ) and full scale must be  $\leq 4.55 V_{DC}$ . See [Figure 6](#)
- (2) No connection exists between  $AV^+$  and  $DV^+$  on the chip. To ensure accuracy, it is required that the  $AV^+$  and  $DV^+$  be connected together to a power supply with separate bypass filter at each  $V^+$  pin.
- (3) One LSB is referenced to 10 bits of resolution.
- (4) All the timing specifications are tested at the TTL logic levels,  $V_{IL} = 0.8V$  for a falling edge and  $V_{IH} = 2.0V$  for a rising. TRI-STATE voltage level is forced to 1.4V.
- (5) Typicals are at  $T_J = T_A = 25^\circ C$  and represent most likely parametric norm.
- (6) Tested limits are ensured to AOQL (Average Outgoing Quality Level).
- (7) Total unadjusted error includes offset, full-scale, linearity, multiplexer, and hold step errors.
- (8) The DC common-mode error is measured in the differential multiplexer mode with the assigned positive and negative input channels shorted together.

**Electrical Characteristics (continued)**

The following specifications apply for  $V^+ = AV^+ = DV^+ = +5.0 V_{DC}$ ,  $V_{REF+} = 2.5 V_{DC}$ ,  $V_{REF-} = GND$ ,  $V_{IN-} = 2.5V$  for Signed Characteristics,  $V_{IN-} = GND$  for Unsigned Characteristics and  $f_{CLK} = 2.5 MHz$  unless otherwise specified. **Boldface limits apply for  $T_A = T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_A = T_J = +25^{\circ}C$ .**<sup>(1)(2)(3)(4)</sup>

## APPLICATIONS HINTS

**The ADC10731, ADC10732 and ADC10734 are obsolete and discussed here for reference only.**

The ADC10731/2/4/8 use successive approximation to digitize an analog input voltage. The DAC portion of the A/D converters uses a capacitive array and a resistive ladder structure. The structure of the DAC allows a very simple switching scheme to provide a versatile analog input multiplexer. This structure also provides a sample/hold. The ADC10731/2/4/8 have a 2.5V CMOS bandgap reference. The serial digital I/O interfaces to MICROWIRE and MICROWIRE+.

### DIGITAL INTERFACE

There are two modes of operation. The fastest throughput rate is obtained when  $\overline{CS}$  is kept low during a conversion. The timing diagrams in [Figure 35](#) and [Figure 36](#) show the operation of the devices in this mode.  $\overline{CS}$  must be taken high for at least  $t_{CS(H)}$  (1 CLK) between conversions. This is necessary to reset the internal logic. [Figure 37](#) and [Figure 38](#) show the operation of the devices when  $\overline{CS}$  is taken high while the ADC10731/2/4/8 is converting.  $\overline{CS}$  may be taken high during the conversion and kept high indefinitely to delay the output data. This mode simplifies the interface to other devices while the ADC10731/2/4/8 is busy converting.

### Getting Started with a Conversion

The ADC10731/2/4/8 need to be initialized after the power supply voltage is applied. If  $\overline{CS}$  is low when the supply voltage is applied then  $\overline{CS}$  needs to be taken high for at least  $t_{CS(H)}$  (1 clock period). The data output after the first conversion is not valid.

### Software and Hardware Power Up/Down

These devices have the capability of software or hardware power down. [Figure 33](#) and [Figure 34](#) show the timing diagrams for hardware and software power up/down. In the case of hardware power down note that  $\overline{CS}$  needs to be high for  $t_{PC}$  after PD is taken low. When PD is high the device is powered down. The total quiescent current, when powered down, is typically 200  $\mu$ A with the clock at 2.5 MHz and 3  $\mu$ A with the clock off. The actual voltage level applied to a digital input will effect the power consumption of the device during power down. CMOS logic levels will give the least amount of current drain (3  $\mu$ A). TTL logic levels will increase the total current drain to 200  $\mu$ A.

These devices have resistive reference ladders which draw 600  $\mu$ A with a 2.5V reference voltage. The internal band gap reference voltage shuts down when power down is activated. If an external reference voltage is used, it will have to be shut down to minimize the total current drain of the device.

### ARCHITECTURE

Before a conversion is started, during the analog input sampling period, ( $t_A$ ), the sampled data comparator is zeroed. As the comparator is being zeroed the channel assigned to be the positive input is connected to the A/D's input capacitor. (The assignment procedure is explained in the [Table 1](#) section.) This charges the input 32C capacitor of the DAC to the positive analog input voltage. The switches shown in the DAC portion of [Figure 39](#) are set for this zeroing/acquisition period. The voltage at the input and output of the comparator are at equilibrium at this time. When the conversion is started, the comparator feedback switches are opened and the 32C input capacitor is then switched to the assigned negative input voltage. When the comparator feedback switch opens, a fixed amount of charge is trapped on the common plates of the capacitors. The voltage at the input of the comparator moves away from equilibrium when the 32C capacitor is switched to the assigned negative input voltage, causing the output of the comparator to go high ("1") or low ("0"). The SAR next goes through an algorithm, controlled by the output state of the comparator, that redistributes the charge on the capacitor array by switching the voltage on one side of the capacitors in the array. The objective of the SAR algorithm is to return the voltage at the input of the comparator as close as possible to equilibrium.

The switch position information at the completion of the successive approximation routine is a direct representation of the digital output. This data is then available to be shifted on the DO pin.

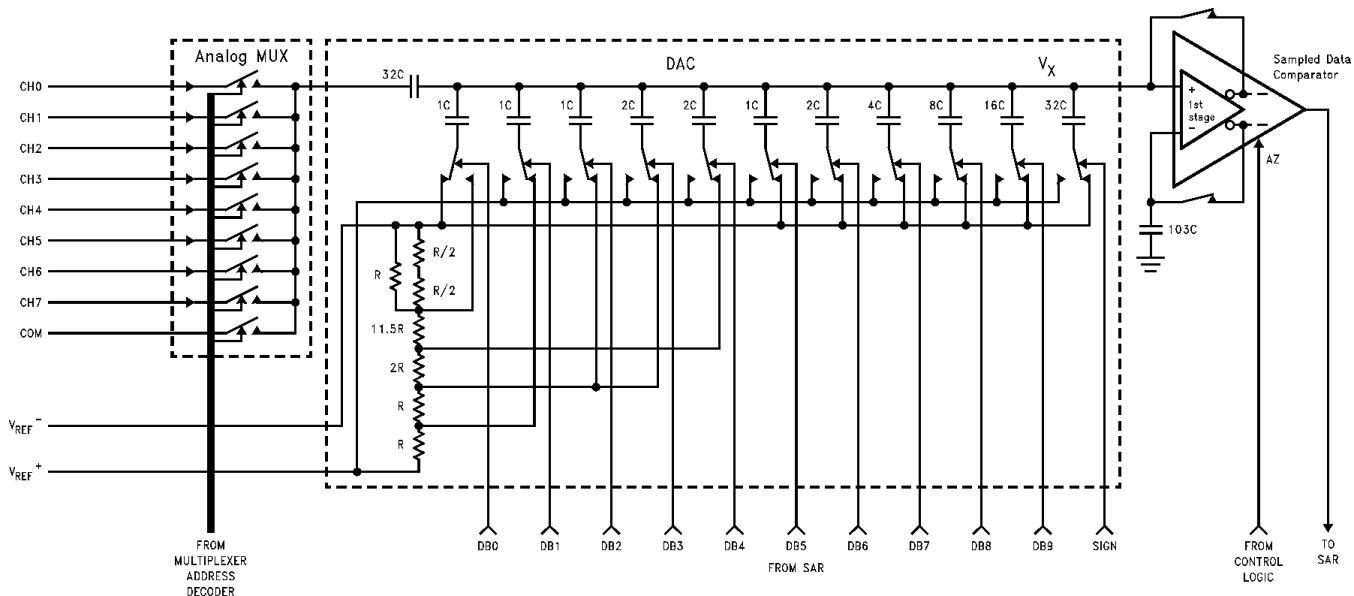

Figure 39. Detailed Diagram of the ADC10738 DAC and Analog Multiplexer Stages

## APPLICATIONS INFORMATION

### Multiplexer Configuration

The design of these converters utilizes a sampled-data comparator structure, which allows a differential analog input to be converted by the successive approximation routine.

The actual voltage converted is always the difference between an assigned “+” input terminal and a “-” input terminal. The polarity of each input terminal or pair of input terminals being converted indicates which line the converter expects to be the most positive.

A unique input multiplexing scheme has been utilized to provide multiple analog channels. The input channels can be software configured into three modes: differential, single-ended, or pseudo-differential. [Analog Input Multiplexer Options](#) illustrates the three modes using the 4-channel MUX of the ADC10734. The eight inputs of the ADC10738 can also be configured in any of the three modes. The single-ended mode has CH0–CH3 assigned as the positive input with COM serving as the negative input. In the differential mode, the ADC10734 channel inputs are grouped in pairs, CH0 with CH1 and CH2 with CH3. The polarity assignment of each channel in the pair is interchangeable. Finally, in the pseudo-differential mode CH0–CH3 are positive inputs referred to COM which is now a pseudo-ground. This pseudo-ground input can be set to any potential within the input common-mode range of the converter. The analog signal conditioning required in transducer-based data acquisition systems is significantly simplified with this type of input flexibility. One converter package can now handle ground-referred inputs and true differential inputs as well as signals referred to a specific voltage.

The analog input voltages for each channel can range from 50 mV below GND to 50 mV above  $V^+ = DV^+ = AV^+$  without degrading conversion accuracy. If the voltage on an unselected channel exceeds these limits it may corrupt the reading of the selected channel.

### Reference Considerations

The voltage difference between the  $V_{REF}^+$  and  $V_{REF}^-$  inputs defines the analog input voltage span (the difference between  $V_{IN}(\text{Max})$  and  $V_{IN}(\text{Min})$ ) over which 1023 positive and 1024 negative possible output codes apply.

The value of the voltage on the  $V_{REF}^+$  or  $V_{REF}^-$  inputs can be anywhere between  $AV^+ + 50 \text{ mV}$  and  $-50 \text{ mV}$ , so long as  $V_{REF}^+$  is greater than  $V_{REF}^-$ . The ADC10731/2/4/8 can be used in either ratiometric applications or in systems requiring absolute accuracy. The reference pins must be connected to a voltage source capable of driving the minimum reference input resistance of 5 k $\Omega$ .

The internal 2.5V bandgap reference in the ADC10731/2/4/8 is available as an output on the VREFOut pin. To ensure optimum performance this output needs to be bypassed to ground with 100  $\mu$ F aluminum electrolytic or tantalum capacitor. The reference output can be unstable with capacitive loads greater than 100 pF and less than 100  $\mu$ F. Any capacitive loading less than 100 pF and greater than 100  $\mu$ F will not cause oscillation. Lower output noise can be obtained by increasing the output capacitance. A 100  $\mu$ F capacitor will yield a typical noise floor of

$$200 \text{ nV}/\sqrt{\text{Hz}} \quad (1)$$

The pseudo-differential and differential multiplexer modes allow for more flexibility in the analog input voltage range since the “zero” reference voltage is set by the actual voltage applied to the assigned negative input pin.

In a ratiometric system (Figure 40), the analog input voltage is proportional to the voltage used for the A/D reference. This voltage may also be the system power supply, so  $V_{\text{REF}+}$  can also be tied to  $AV^+$ . This technique relaxes the stability requirements of the system reference as the analog input and A/D reference move together maintaining the same output code for a given input condition.

For absolute accuracy (Figure 41), where the analog input varies between very specific voltage limits, the reference pin can be biased with a time- and temperature-stable voltage source that has excellent initial accuracy. The LM4040, LM4041 and LM185 references are suitable for use with the ADC10731/2/4/8.

The minimum value of  $V_{\text{REF}}$  ( $V_{\text{REF}} = V_{\text{REF}+} - V_{\text{REF}-}$ ) can be quite small (see [Typical Performance Characteristics](#)) to allow direct conversion of transducer outputs providing less than a 5V output span. Particular care must be taken with regard to noise pickup, circuit layout and system error voltage sources when operating with a reduced span due to the increased sensitivity of the converter (1 LSB equals  $V_{\text{REF}}/1024$ ).

### The Analog Inputs

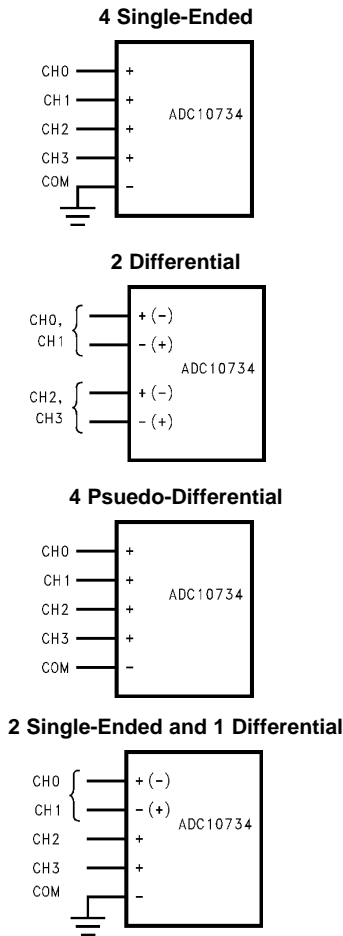

Due to the sampling nature of the analog inputs, at the clock edges short duration spikes of current will be seen on the selected assigned negative input. Input bypass capacitors should not be used if the source resistance is greater than 1 k $\Omega$  since they will average the AC current and cause an effective DC current to flow through the analog input source resistance. An op amp RC active lowpass filter can provide both impedance buffering and noise filtering should a high impedance signal source be required. Bypass capacitors may be used when the source impedance is very low without any degradation in performance.

In a true differential input stage, a signal that is common to both “+” and “-” inputs is canceled. For the ADC10731/2/4/8, the positive input of a selected channel pair is only sampled once before the start of a conversion during the acquisition time ( $t_A$ ). The negative input needs to be stable during the complete conversion sequence because it is sampled before each decision in the SAR sequence. Therefore, any AC common-mode signal present on the analog inputs will not be completely canceled and will cause some conversion errors. For a sinusoid common-mode signal this error is:

$$V_{\text{ERROR(max)}} = V_{\text{PEAK}} (2 \pi f_{\text{CM}}) (t_C) \quad (2)$$

where  $f_{\text{CM}}$  is the frequency of the common-mode signal,  $V_{\text{PEAK}}$  is its peak voltage value, and  $t_C$  is the A/D's conversion time ( $t_C = 12/f_{\text{CLK}}$ ). For example, for a 60 Hz common-mode signal to generate a  $\frac{1}{4}$  LSB error (0.61 mV) with a 4.8  $\mu$ s conversion time, its peak value would have to be approximately 337 mV.

## Optional Adjustments

### Zero Error

The zero error of the A/D converter relates to the location of the first riser of the transfer function (see [Figure 7](#) [Figure 8](#)) and can be measured by grounding the minus input and applying a small magnitude voltage to the plus input. Zero error is the difference between actual DC input voltage which is necessary to just cause an output digital code transition from 000 0000 0000 to 000 0000 0001 and the ideal  $\frac{1}{2}$  LSB value ( $\frac{1}{2}$  LSB = 1.22 mV for  $V_{REF} = + 2.500V$ ).

The zero error of the A/D does not require adjustment. If the minimum analog input voltage value,  $V_{IN}(\text{Min})$ , is not ground, the effective “zero” voltage can be adjusted to a convenient value. The converter can be made to output an all zeros digital code for this minimum input voltage by biasing any minus input to  $V_{IN}(\text{Min})$ . This is useful for either the differential or pseudo-differential input channel configurations.

### Full-Scale

The full-scale adjustment can be made by applying a differential input voltage which is  $1\frac{1}{2}$  LSB down from the desired analog full-scale voltage range and then adjusting the  $V_{REF}$  voltage ( $V_{REF} = V_{REF}^{+} - V_{REF}^{-}$ ) for a digital output code changing from 011 1111 1110 to 011 1111 1111. In bipolar signed operation this only adjusts the positive full scale error.

### Adjusting for an Arbitrary Analog Input Voltage Range

If the analog zero voltage of the A/D is shifted away from ground (for example, to accommodate an analog input signal which does not go to ground), this new zero reference should be properly adjusted first. A plus input voltage which equals this desired zero reference plus  $\frac{1}{2}$  LSB is applied to selected plus input and the zero reference voltage at the corresponding minus input should then be adjusted to just obtain the 000 0000 0000 to 000 0000 0001 code transition.

The full-scale adjustment should be made [with the proper minus input voltage applied] by forcing a voltage to the plus input which is given by:

$$V_{IN(+)} f_s \text{ adj} = V_{MAX} - 1.5 \left[ \frac{(V_{MAX} - V_{MIN})}{2^n} \right] \quad (3)$$

where  $V_{MAX}$  equals the high end of the analog input range,  $V_{MIN}$  equals the low end (the offset zero) of the analog range. Both  $V_{MAX}$  and  $V_{MIN}$  are ground referred. The  $V_{REF}$  ( $V_{REF} = V_{REF}^{+} - V_{REF}^{-}$ ) voltage is then adjusted to provide a code change from 011 1111 1110 to 011 1111 1111. Note, when using a pseudo-differential or differential multiplexer mode where  $V_{REF+}$  and  $V_{REF-}$  are placed within the  $V^{+}$  and GND range, the individual values of  $V_{REF}$  and  $V_{REF-}$  do not matter, only the difference sets the analog input voltage span. This completes the adjustment procedure.

## The Input Sample and Hold

The ADC10731/2/4/8's sample/hold capacitor is implemented in the capacitor array. After the channel address is loaded, the array is switched to sample the selected positive analog input. The sampling period for the assigned positive input is maintained for the duration of the acquisition time ( $t_A$ ) 4.5 clock cycles.

This acquisition window of 4.5 clock cycles is available to allow the voltage on the capacitor array to settle to the positive analog input voltage. Any change in the analog voltage on a selected positive input before or after the acquisition window will not effect the A/D conversion result.

In the simplest case, the array's acquisition time is determined by the  $R_{ON}$  (3 k $\Omega$ ) of the multiplexer switches, the stray input capacitance  $C_{S1}$  (3.5 pF) and the total array ( $C_L$ ) and stray ( $C_{S2}$ ) capacitance (48 pF). For a large source resistance the analog input can be modeled as an RC network as shown in Figure 42. The values shown yield an acquisition time of about 1.1  $\mu$ s for 10-bit unipolar or 10-bit plus sign accuracy with a zero-to-full-scale change in the input voltage. External source resistance and capacitance will lengthen the acquisition time and should be accounted for. Slowing the clock will lengthen the acquisition time, thereby allowing a larger external source resistance.

Figure 42. Analog Input Model

The signal-to-noise ratio of an ideal A/D is the ratio of the RMS value of the full scale input signal amplitude to the value of the total error amplitude (including noise) caused by the transfer function of the ideal A/D. An ideal 10-bit plus sign A/D converter with a total unadjusted error of 0 LSB would have a signal-to-(noise + distortion) ratio of about 68 dB, which can be derived from the equation:

$$S/(N + D) = 6.02(n) + 1.76 \quad (4)$$

where  $S/(N + D)$  is in dB and  $n$  is the number of bits.

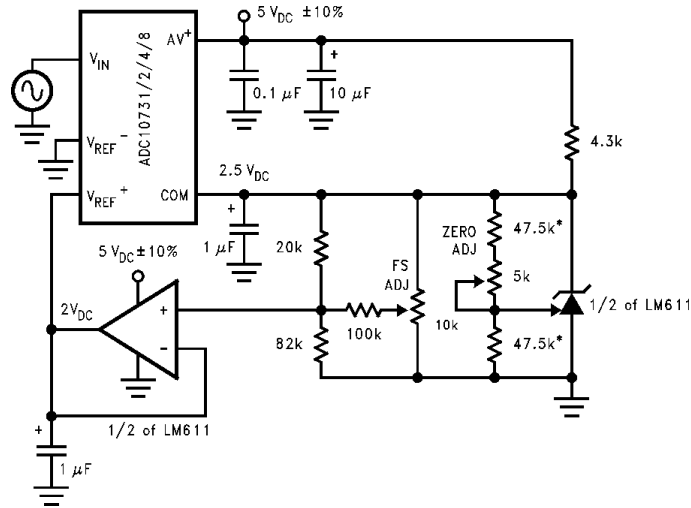

$$(R1 + R2) // R3 \leq 1k$$

**Note:** Diodes are 1N914.

**Note:** The protection diodes should be able to withstand the output current of the op amp under current limit.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
