LPV321 Single/LPV358 Dual/LPV324 Quad General Purpose, Low Voltage, Low Power, Rail-to-Rail Output Operational Amplifiers

General Description

The LPV321/358/324 are low power (9 μ A per channel at 5.0V) versions of the LMV321/358/324 op amps. This is another addition to the LMV321/358/324 family of commodity op amps.

The LPV321/358/324 are the most cost effective solutions for the applications where low voltage, low power operation, space saving and low price are needed. The LPV321/358/324 have rail-to-rail output swing capability and the input common-mode voltage range includes ground. They all exhibit excellent speed-power ratio, achieving 5 kHz of bandwidth with a supply current of only 9 μ A.

The LPV321 is available in space saving 5-Pin SC70, which is approximately half the size of 5-Pin SOT23. The small package saves space on PC boards, and enables the design of small portable electronic devices. It also allows the designer to place the device closer to the signal source to reduce noise pickup and increase signal integrity.

The chips are built with National's advanced submicron silicon-gate BiCMOS process. The LPV321/358/324 have bipolar input and output stages for improved noise performance and higher output current drive.

Features

(For $V^+ = 5V$ and $V^- = 0V$, typical unless otherwise noted)

- Guaranteed 2.7V and 5V performance
 - No crossover distortion
 - Space saving package
 - Industrial temperature range
 - Gain-bandwidth product
 - Low supply current
 - Rail-to-rail output swing @ 100 k Ω Load
 - V_{CM}
- | | | | | | | | | | |
|------------|----------------|----------------|---------|-----------|------------|------------|----------------|---------------|-----------------------|
| 5-Pin SC70 | 2.0x2.1x1.0 mm | -40°C to +85°C | 152 kHz | 9 μ A | 15 μ A | 28 μ A | $V^+ - 3.5$ mV | $V^- + 90$ mV | -0.2V to $V^+ - 0.8V$ |
|------------|----------------|----------------|---------|-----------|------------|------------|----------------|---------------|-----------------------|

Applications

- Active filters
- General purpose low voltage applications
- General purpose portable devices

Connection Diagrams

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

ESD Tolerance (Note 2)	
Human Body Model	
LPV324	2000V
LPV358	1500V
LPV321	1500V
Machine Model	100V
Differential Input Voltage	±Supply Voltage
Supply Voltage (V ⁺ -V ⁻)	5.5V
Output Short Circuit to V ⁺	(Note 3)
Output Short Circuit to V ⁻	(Note 4)
Soldering Information	

Infrared or Convection (20 sec)	235°C
Storage Temperature Range	-65°C to 150°C
Junction Temp. (T _J , max) (Note 5)	150°C

Operating Ratings (Note 1)

Supply Voltage	2.7V to 5V
Temperature Range	-40°C to +85°C
Thermal Resistance (θ _{JA})(Note 10)	
5-Pin SC70	478°C/W
5-Pin SOT23	265°C/W
8-Pin SOIC	190°C/W
8-Pin MSOP	235°C/W
14-Pin SOIC	145°C/W
14-Pin TSSOP	155°C/W

2.7V DC Electrical Characteristics

Unless otherwise specified, all limits guaranteed for T_J = 25°C, V⁺ = 2.7V, V⁻ = 0V, V_{CM} = 1.0V, V_O = V⁺/2 and R_L > 1 MΩ.

Symbol	Parameter	Conditions	Min (Note 7)	Typ (Note 6)	Max (Note 7)	Units
V _{OS}	Input Offset Voltage			1.2	7	mV
TCV _{OS}	Input Offset Voltage Average Drift			2		μV/°C
I _B	Input Bias Current			1.7	50	nA
I _{OS}	Input Offset Current			0.6	40	nA
CMRR	Common Mode Rejection Ratio	0V ≤ V _{CM} ≤ 1.7V	50	70		dB
PSRR	Power Supply Rejection Ratio	2.7V ≤ V ⁺ ≤ 5V V _O = 1V, V _{CM} = 1V	50	65		dB
V _{CM}	Input Common-Mode Voltage Range	For CMRR ≥ 50 dB	0	-0.2	1.7	V
V _O	Output Swing	R _L = 100 kΩ to 1.35V	V ⁺ -100	V ⁺ -3		mV
				80	180	mV
I _S	Supply Current	LPV321		4	8	μA
		LPV358 Both Amplifiers		8	16	μA
		LPV324 All Four Amplifiers		16	24	μA

2.7V AC Electrical Characteristics

Unless otherwise specified, all limits guaranteed for T_J = 25°C, V⁺ = 2.7V, V⁻ = 0V, V_{CM} = 1.0V, V_O = V⁺/2 and R_L > 1 MΩ.

Symbol	Parameter	Conditions	Min (Note 7)	Typ (Note 6)	Max (Note 7)	Units
GBWP	Gain-Bandwidth Product	C _L = 22 pF		112		kHz
Φ _m	Phase Margin			97		Deg
G _m	Gain Margin			35		dB
e _n	Input-Referred Voltage Noise	f = 1 kHz		178		$\frac{nV}{\sqrt{Hz}}$
i _n	Input-Referred Current Noise	f = 1 kHz		0.50		$\frac{pA}{\sqrt{Hz}}$

5V DC Electrical Characteristics

Unless otherwise specified, all limits guaranteed for $T_J = 25^\circ\text{C}$, $V^+ = 5\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = 2.0\text{V}$, $V_O = V^+/2$ and $R_L > 1\text{M}\Omega$. **Boldface** limits apply at the temperature extremes.

Symbol	Parameter	Conditions	Min (Note 7)	Typ (Note 6)	Max (Note 7)	Units
V_{OS}	Input Offset Voltage			1.5	7 10	mV
TCV_{OS}	Input Offset Voltage Average Drift			2		$\mu\text{V}/^\circ\text{C}$
I_{B}	Input Bias Current			2	50 60	nA
I_{OS}	Input Offset Current			0.6	40 50	nA
CMRR	Common Mode Rejection Ratio	$0\text{V} \leq V_{\text{CM}} \leq 4\text{V}$	50	71		dB
PSRR	Power Supply Rejection Ratio	$2.7\text{V} \leq V^+ \leq 5\text{V}$ $V_O = 1\text{V}$, $V_{\text{CM}} = 1\text{V}$	50	65		dB
V_{CM}	Input Common-Mode Voltage Range	For CMRR ≥ 50 dB	0	-0.2 4.2	4	V
A_V	Large Signal Voltage Gain (Note 8)	$R_L = 100\text{ k}\Omega$	15 10	100		V/mV
V_O	Output Swing	$R_L = 100\text{ k}\Omega$ to 2.5V	$V^+ - 100$ $V^+ - 200$	$V^+ - 3.5$ 90	180 220	mV
I_O	Output Short Circuit Current Sourcing	LPV324, LPV358, and LPV321 $V_O = 0\text{V}$	2	16		mA
	Output Short Circuit Current Sinking	LPV321 $V_O = 5\text{V}$	20	60		mA
		LPV324 and LPV358 $V_O = 5\text{V}$	11	16		mA
I_S	Supply Current	LPV321		9	12 15	μA
		LPV358		15	20	μA
		Both amplifiers			24	μA
		LPV324		28	42	μA
		All four amplifiers			46	μA

5V AC Electrical Characteristics

Unless otherwise specified, all limits guaranteed for $T_J = 25^\circ\text{C}$, $V^+ = 5\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = 2.0\text{V}$, $V_O = V^+/2$ and $R_L > 1\text{M}\Omega$. **Boldface** limits apply at the temperature extremes.

Symbol	Parameter	Conditions	Min (Note 7)	Typ (Note 6)	Min (Note 7)	Units
SR	Slew Rate	(Note 9)		0.1		V/ μs
GBWP	Gain-Bandwidth Product	$C_L = 22\text{ pF}$		152		kHz
Φ_m	Phase Margin			87		Deg
G_m	Gain Margin			19		dB
e_n	Input-Referred Voltage Noise	$f = 1\text{ kHz}$,		146		$\frac{\text{nV}}{\sqrt{\text{Hz}}}$
i_n	Input-Referred Current Noise	$f = 1\text{ kHz}$		0.30		$\frac{\text{pA}}{\sqrt{\text{Hz}}}$

5V AC Electrical Characteristics (Continued)

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

Note 2: Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC)
Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

Note 3: Shorting output to V^+ will adversely affect reliability.

Note 4: Shorting output to V^- will adversely affect reliability.

Note 5: The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / \theta_{JA}$. All numbers apply for packages soldered directly onto a PC Board.

Note 6: Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

Note 7: All limits are guaranteed by testing or statistical analysis.

Note 8: R_L is connected to V^- . The output voltage is $0.5V \leq V_O \leq 4.5V$.

Note 9: Connected as voltage follower with 3V step input. Number specified is the slower of the positive and negative slew rates.

Note 10: All numbers are typical, and apply for packages soldered directly onto a PC board in still air.

Application Information

BENEFITS OF THE LPV321/358/324

Size

The small footprints of the LPV321/358/324 packages save space on printed circuit boards, and enable the design of smaller electronic products, such as cellular phones, pagers, or other portable systems. The low profile of the LPV321/358/324 make them possible to use in PCMCIA type III cards.

Signal Integrity

Signals can pick up noise between the signal source and the amplifier. By using a physically smaller amplifier package, the LPV321/358/324 can be placed closer to the signal source, reducing noise pickup and increasing signal integrity.

Simplified Board Layout

These products help you to avoid using long pc traces in your pc board layout. This means that no additional components, such as capacitors and resistors, are needed to filter out the unwanted signals due to the interference between the long pc traces.

Low Supply Current

These devices will help you to maximize battery life. They are ideal for battery powered systems.

Low Supply Voltage

National provides guaranteed performance at 2.7V and 5V. These guarantees ensure operation throughout the battery lifetime.

Rail-to-Rail Output

Rail-to-rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating on low supply voltages.

Input Includes Ground

Allows direct sensing near GND in single supply operation. The differential input voltage may be larger than V^+ without damaging the device. Protection should be provided to prevent the input voltages from going negative more than $-0.3V$ (at $25^\circ C$). An input clamp diode with a resistor to the IC input terminal can be used.

CAPACITIVE LOAD TOLERANCE

The LPV321/358/324 can directly drive 200 pF in unity-gain without oscillation. The unity-gain follower is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers. The combination of the amplifier's output impedance and the capacitive load induces phase lag. This results in either an underdamped pulse response or oscillation. To drive a heavier capacitive load, circuit in *Figure 1* can be used.

FIGURE 1. Indirectly Driving A Capacitive Load Using Resistive Isolation

In *Figure 1*, the isolation resistor R_{ISO} and the load capacitor C_L form a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of R_{ISO} . The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. *Figure 2* is an output waveform of *Figure 1* using 100 k Ω for R_{ISO} and 1000 pF for C_L .

FIGURE 2. Pulse Response of the LPV324 Circuit in Figure 1

The circuit in *Figure 3* is an improvement to the one in *Figure 1* because it provides DC accuracy as well as AC stability. If there were a load resistor in *Figure 1*, the output would be voltage divided by R_{ISO} and the load resistor. Instead, in *Figure 3*, R_F provides the DC accuracy by using feed-forward techniques to connect V_{IN} to R_L . Caution is needed in choosing the value of R_F due to the input bias current of the LPV321/358/324. C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop. Increased capacitive drive is possible by increasing the value of C_F . This in turn will slow down the pulse response.

Application Information (Continued)

FIGURE 3. Indirectly Driving A Capacitive Load with DC Accuracy

INPUT BIAS CURRENT CANCELLATION

The LPV321/358/324 family has a bipolar input stage. The typical input bias current of LPV321/358/324 is 1.5 nA with 5V supply. Thus a 100 kΩ input resistor will cause 0.15 mV of error voltage. By balancing the resistor values at both inverting and non-inverting inputs, the error caused by the amplifier's input bias current will be reduced. The circuit in *Figure 4* shows how to cancel the error caused by input bias current.

FIGURE 4. Cancelling the Error Caused by Input Bias Current

TYPICAL SINGLE-SUPPLY APPLICATION CIRCUITS

Difference Amplifier

The difference amplifier allows the subtraction of two voltages or, as a special case, the cancellation of a signal common to two inputs. It is useful as a computational amplifier, in making a differential to single-ended conversion or in rejecting a common mode signal.

$$V_{OUT} = \left(\frac{R_1 + R_2}{R_3 + R_4}\right) \frac{R_4}{R_1} V_2 - \frac{R_2}{R_1} V_1 + \left(\frac{R_1 + R_2}{R_3 + R_4}\right) \frac{R_3}{R_1} \cdot \frac{V^+}{2}$$

for $R_1 = R_3$ and $R_2 = R_4$

$$V_{OUT} = \frac{R_2}{R_1} (V_2 - V_1) + \frac{V^+}{2}$$

FIGURE 5. Difference Amplifier

Instrumentation Circuits

The input impedance of the previous difference amplifier is set by the resistor R_1 , R_2 , R_3 , and R_4 . To eliminate the problems of low input impedance, one way is to use a voltage follower ahead of each input as shown in the following two instrumentation amplifiers.

Three-op-amp Instrumentation Amplifier

The quad LPV324 can be used to build a three-op-amp instrumentation amplifier as shown in *Figure 6*

FIGURE 6. Three-op-amp Instrumentation Amplifier

The first stage of this instrumentation amplifier is a differential-input, differential-output amplifier, with two voltage followers. These two voltage followers assure that the input impedance is over 100 MΩ. The gain of this instrumentation amplifier is set by the ratio of R_2/R_1 . R_3 should equal R_1 and R_4 equal R_2 . Matching of R_3 to R_1 and R_4 to R_2 affects the CMRR. For good CMRR over temperature, low drift resistors should be used. Making R_4 slightly smaller than R_2 and adding a trim pot equal to twice the difference between R_2 and R_4 will allow the CMRR to be adjusted for optimum.

Application Information (Continued)

Two-op-amp Instrumentation Amplifier

A two-op-amp instrumentation amplifier can also be used to make a high-input-impedance DC differential amplifier (Figure 7). As in the three-op-amp circuit, this instrumentation amplifier requires precise resistor matching for good CMRR. R_4 should equal to R_1 and R_3 should equal R_2 .

$$V_O = \left(1 + \frac{R_4}{R_3}\right)(V_2 - V_1), \text{ where } R_1 = R_4 \text{ and } R_2 = R_3$$

As shown: $V_O = 2(V_2 - V_1)$

FIGURE 7. Two-op-amp Instrumentation Amplifier

Single-Supply Inverting Amplifier

There may be cases where the input signal going into the amplifier is negative. Because the amplifier is operating in single supply voltage, a voltage divider using R_3 and R_4 is implemented to bias the amplifier so the input signal is within the input common-mode voltage range of the amplifier. The capacitor C_1 is placed between the inverting input and resistor R_1 to block the DC signal going into the AC signal source, V_{IN} . The values of R_1 and C_1 affect the cutoff frequency, $f_c = 1/2\pi R_1 C_1$.

As a result, the output signal is centered around mid-supply (if the voltage divider provides $V^+/2$ at the non-inverting input). The output can swing to both rails, maximizing the signal-to-noise ratio in a low voltage system.

$$V_{OUT} = -\frac{R_2}{R_1} V_{IN}$$

FIGURE 8. Single-Supply Inverting Amplifier

ACTIVE FILTER

Simple Low-Pass Active Filter

The simple low-pass filter is shown in Figure 9. Its low-frequency gain ($\omega \rightarrow 0$) is defined by $-R_3/R_1$. This allows low-frequency gains other than unity to be obtained. The filter has a -20 dB/decade roll-off after its corner frequency f_c . R_2 should be chosen equal to the parallel combination of R_1 and R_3 to minimize errors due to bias current. The frequency response of the filter is shown in Figure 10

$$A_L = -\frac{R_3}{R_1}$$

$$f_c = \frac{1}{2\pi R_3 C_1}$$

$$R_2 = R_1 \parallel R_3$$

FIGURE 9. Simple Low-Pass Active Filter

FIGURE 10. Frequency Response of Simple Low-pass Active Filter in Figure 9

Note that the single-op-amp active filters are used in to the applications that require low quality factor, $Q (\leq 10)$, low frequency (≤ 5 kHz), and low gain (≤ 10), or a small value for the product of gain times $Q (\leq 100)$. The op amp should have an open loop voltage gain at the highest frequency of interest at least 50 times larger than the gain of the filter at this frequency. In addition, the selected op amp should have a slew rate that meets the following requirement:

$$\text{Slew Rate} \geq 0.5 \times (\omega_H V_{OPP}) \times 10^{-6} \text{V}/\mu\text{sec}$$

Where ω_H is the highest frequency of interest, and V_{OPP} is the output peak-to-peak voltage.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor follows the provisions of the Product Stewardship Guide for Customers (CSP-9-111C2) and Banned Substances and Materials of Interest Specification (CSP-9-111S2) for regulatory environmental compliance. Details may be found at: www.national.com/quality/green.

Lead free products are RoHS compliant.
