

DUAL, 10-BIT 275 MSPS DIGITAL-TO-ANALOG CONVERTER

Check for Samples: [DAC5652](#)

FEATURES

- 10-Bit Dual Transmit Digital-to-Analog Converter (DAC)
- 275 MSPS Update Rate
- Single Supply: 3.0 V to 3.6 V
- High Spurious-Free Dynamic Range (SFDR): 80 dBc at 5 MHz
- High Third-Order Two-Tone Intermodulation (IMD3): 78 dBc at 15.1 MHz and 16.1 MHz
- Independent or Single Resistor Gain Control
- Dual or Interleaved Data
- On-Chip 1.2-V Reference
- Low Power: 290 mW

- Power-Down Mode: 9 mW
- Package: 48-Pin Thin-Quad Flat Pack (TQFP)

APPLICATIONS

- Cellular Base Transceiver Station Transmit Channel
 - CDMA: W-CDMA, CDMA2000, IS-95
 - TDMA: GSM, IS-136, EDGE/UWC-136
- Medical/Test Instrumentation
- Arbitrary Waveform Generators (ARB)
- Direct Digital Synthesis (DDS)
- Cable Modem Termination System (CMTS)

DESCRIPTION

The DAC5652 is a monolithic, dual-channel, 10-bit, high-speed DAC with on-chip voltage reference.

Operating with update rates of up to 275 MSPS, the DAC5652 offers exceptional dynamic performance, tight-gain, and offset matching characteristics that make it suitable in either I/Q baseband or direct IF communication applications.

Each DAC has a high-impedance, differential-current output, suitable for single-ended or differential analog-output configurations. External resistors allow scaling of the full-scale output current for each DAC separately or together, typically between 2 mA and 20 mA. An accurate on-chip voltage reference is temperature-compensated and delivers a stable 1.2-V reference voltage. Optionally, an external reference may be used.

The DAC5652 has two, 10-bit, parallel input ports with separate clocks and data latches. For flexibility, the DAC5652 also supports multiplexed data for each DAC on one port when operating in the interleaved mode.

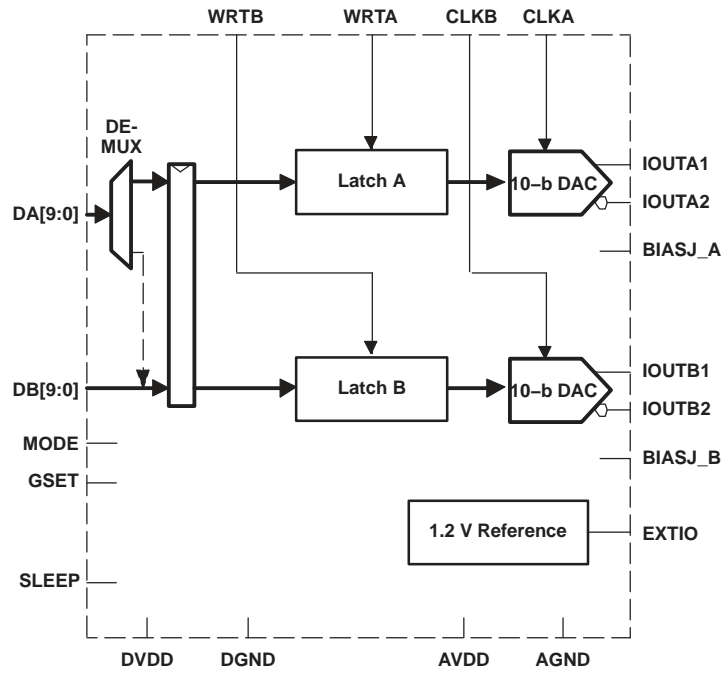

The DAC5652 has been specifically designed for a differential transformer-coupled output with a 50-Ω doubly-terminated load. For a 20-mA full-scale output current, both a 4:1 impedance ratio (resulting in an output power of 4 dBm) and 1:1 impedance ratio transformer (–2 dBm output power) are supported.

The DAC5652 is available in a 48-pin TQFP package. Pin compatibility between family members provides 10-bit (DAC5652), 12-bit (DAC5662), and 14-bit (DAC5672) resolution. Furthermore, the DAC5652 is pin compatible to the DAC2900 and AD9763 dual DACs. The device is characterized for operation over the industrial temperature range of –40°C to 85°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

TERMINAL FUNCTIONS

| TERMINAL | | I/O | DESCRIPTION |
|---------------|--------------|-----|--|
| NAME | NO. | | |
| AGND | 38 | I | Analog ground |
| AVDD | 47 | I | Analog supply voltage |
| BIASJ_A | 44 | O | Full-scale output current bias for DACA |
| BIASJ_B | 41 | O | Full-scale output current bias for DACB |
| CLKA/CLKIQ | 18 | I | Clock input for DACA, CLKIQ in interleaved mode |
| CLKB/RESETIQ | 19 | I | Clock input for DACB, RESETIQ in interleaved mode |
| DA[9:0] | 1-10 | I | Data port A. DA9 is MSB and DA0 is LSB. Internal pull-down. |
| DB[9:0] | 23-32 | I | Data port B. DB9 is MSB and DB0 is LSB. Internal pull-down. |
| DGND | 15, 21 | I | Digital ground |
| DVDD | 16, 22 | I | Digital supply voltage |
| EXTIO | 43 | I/O | Internal reference output (bypass with 0.1 μ F to AGND) or external reference input |
| GSET | 42 | I | Gain-setting mode: H – 1 resistor, L – 2 resistors. Internal pullup. |
| IOUTA1 | 46 | O | DACA current output. Full-scale with all bits of DA high. |
| IOUTA2 | 45 | O | DACA complementary current output. Full-scale with all bits of DA low. |
| IOUTB1 | 39 | O | DACB current output. Full-scale with all bits of DB high. |
| IOUTB2 | 40 | O | DACB complementary current output. Full-scale with all bits of DB low. |
| MODE | 48 | I | Mode Select: H – Dual Bus, L – Interleaved. Internal pullup. |
| NC | 11-14, 33-36 | - | Factory use only. Pins must be connected to DGND or left unconnected. |
| SLEEP | 37 | I | Sleep function control input: H – DAC in power-down mode, L – DAC in operating mode. Internal pull-down. |
| WRTA/WRTIQ | 17 | I | Input write signal for PORT A (WRTIQ in interleaving mode) |
| WRTB/SELECTIQ | 20 | I | Input write signal for PORT B (SELECTIQ in interleaving mode) |

ABSOLUTE MAXIMUM RATINGS

over T_A (unless otherwise noted)⁽¹⁾

| | | UNIT |
|---------------------------------------|--|------------------------|
| Supply voltage range | AVDD ⁽²⁾ | –0.5 V to 4 V |
| | DVDD ⁽³⁾ | –0.5 V to 4 V |
| Voltage between AGND and DGND | | –0.5 V to 0.5 V |
| Voltage between AVDD and DVDD | | –0.5 V to 0.5 V |
| Supply voltage range | DA[9:0] and DB[9:0] ⁽³⁾ | –0.5 V to DVDD + 0.5 V |
| | MODE, SLEEP, CLKA, CLKB, WRTA, WRTB ⁽³⁾ | –0.5 V to DVDD + 0.5 V |

| Reference Input | | | | | | |
| V_{EXTIO} | Input voltage | | 0.1 | | 1.25 | V |
| R_I | Input resistance | | | 1 | | M Ω |
| Small signal bandwidth | | | | 300 | | kHz |

(1) Measured differentially through 50 Ω to AGND.

(2) Nominal full-scale current, I_{OUTFS} , equals 32x the I_{BIAS} current.

(3) The lower limit of the output compliance is determined by the CMOS process. Exceeding this limit may result in transistor breakdown, resulting in reduced reliability of the DAC5652 device. The upper limit of the output compliance is determined by the load resistors and full-scale output current. Exceeding the upper limit adversely affects distortion performance and integral nonlinearity.

(4) Use an external buffer amplifier with high-impedance input to drive any external load.

Digital Inputs and Timing

Digital Inputs

The data input ports of the DAC5652 accept a standard positive coding with data bits DA9 and DB9 being the most significant bits (MSB). The converter outputs support a clock rate of up to 275 MSPS. The best performance is typically achieved with a symmetric duty cycle for write and clock; however, the duty cycle may vary as long as the timing specifications are met. Similarly, the setup and hold times may be chosen within their specified limits.

All digital inputs of the DAC5652 are CMOS compatible. Figure 13 and Figure 14 show schematics of the equivalent CMOS digital inputs of the DAC5652. The pullup and pulldown circuitry is approximately equivalent to 100k Ω . The 10-bit digital data input follows the offset positive binary coding scheme. The DAC5652 is designed to operate with a digital supply (DVDD) of 3 V to 3.6 V.

Figure 13. CMOS/TTL Digital Equivalent Input With Internal Pulldown Resistor

Figure 14. CMOS/TTL Digital Equivalent Input With Internal Pullup Resistor

Input Interfaces

The DAC5652 features two operating modes selected by the MODE pin, as shown in Table 1.

- For dual-bus input mode, the device essentially consists of two separate DACs. Each DAC has its own separate data input bus, clock input, and data write signal (data latch-in).
- In single-bus interleaved mode, the data must be presented interleaved at the A-channel input bus. The B-channel input bus is not used in this mode. The clock and write input are now shared by both DACs.

Table 1. Operating Modes

| MODE Pin | MODE pin connected to DGND | MODE pin connected to DVDD |
|-----------|--|---|
| Bus input | Single-bus interleaved mode, clock and write input equal for both DACs | Dual-bus mode, DACs operate independently |

Dual-Bus Data Interface and Timing

In dual-bus mode, the MODE pin is connected to DVDD. The two converter channels within the DAC5652 consist of two independent, 10-bit, parallel data ports. Each DAC channel is controlled by its own set of write (WRTA, WRTB) and clock (CLKA, CLKB) lines. The WRTA/B lines control the channel input latches and the CLKA/B lines control the DAC latches. The data is first loaded into the input latch by a rising edge of the WRTA/B line.

The internal data transfer requires a correct sequence of write and clock inputs, since essentially two clock domains having equal periods (but possibly different phases) are input to the DAC5652. This is defined by a minimum requirement of the time between the rising edge of the clock and the rising edge of the write inputs. This essentially implies that the rising edge of CLKA/B must occur at the same time or before the rising edge of the WRTA/B signal. A minimum delay of 2 ns must be maintained if the rising edge of the clock occurs after the rising edge of the write. Note that these conditions are satisfied when the clock and write inputs are connected externally. Note that all specifications were measured with the WRTA/B and CLKA/B lines connected together.

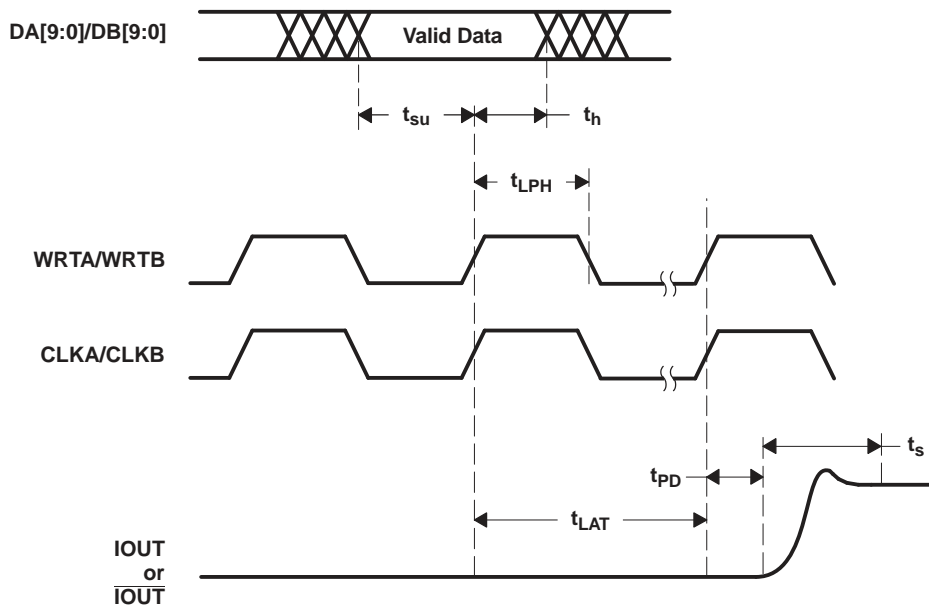

Figure 15. Dual-Bus Mode Operation

Single-Bus Interleaved Data Interface and Timing

In single-bus interleaved mode, the MODE pin is connected to DGND. Figure 16 shows the timing diagram. In interleaved mode, the A- and B-channels share the write input (WRTIQ) and update clock (CLKIQ and internal CLKDACIQ). Multiplexing logic directs the input word at the A-channel input bus to either the A-channel input latch (SELECTIQ is high) or to the B-channel input latch (SELECTIQ is low). When SELECTIQ is high, the data value in the B-channel latch is retained by presenting the latch output data to its input again. When SELECTIQ is low, the data value in the A-channel latch is retained by presenting the latch output data to its input.

In interleaved mode, the A-channel input data rate is twice the update rate of the DAC core. As in dual-bus mode, it is important to maintain a correct sequence of write and clock inputs. The edge-triggered flip-flops latch the A- and B-channel input words on the rising edge of the write input (WRTIQ). This data is presented to the A- and B-DAC latches on the following falling edge of the write inputs. The DAC5652 clock input is divided by a factor of two before it is presented to the DAC latches.

Correct pairing of the A- and B-channel data is done by RESETIQ. In interleaved mode, the clock input CLKIQ is divided by two, which would translate to a non-deterministic relation between the rising edges of the CLKIQ and CLKDACIQ. RESETIQ ensures, however, that the correct position of the rising edge of CLKDACIQ with respect to the data at the input of the DAC latch is determined. CLKDACIQ is disabled (low) when RESETIQ is high.

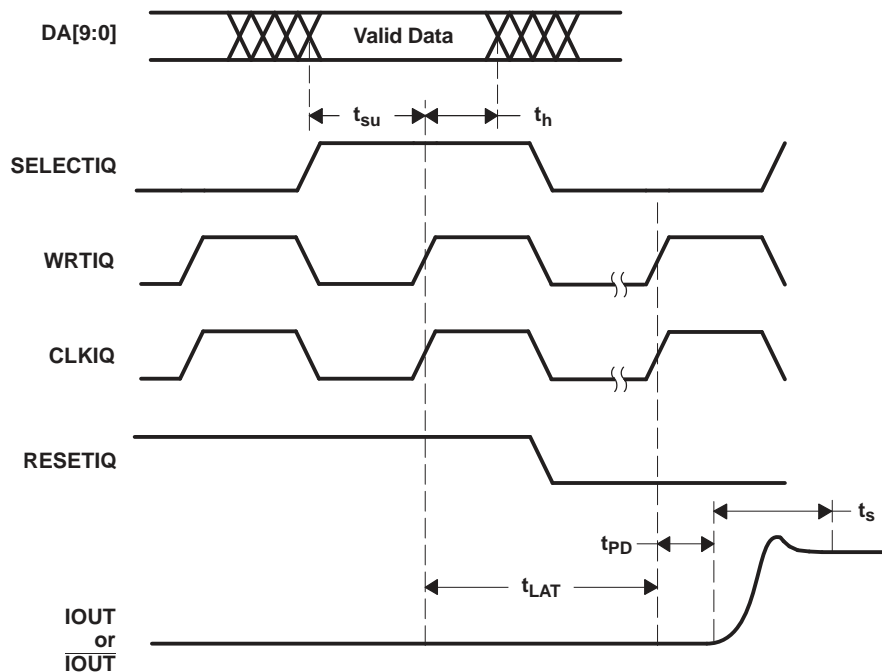

Figure 16. Single-Bus Interleaved Mode Operation

APPLICATION INFORMATION

Theory of Operation

The architecture of the DAC5652 uses a current steering technique to enable fast switching and high update rate. The core element within the monolithic DAC is an array of segmented current sources that are designed to deliver a full-scale output current of up to 20 mA. An internal decoder addresses the differential current switches each time the DAC is updated and a corresponding output current is formed by steering all currents to either output summing node, IOUT1 or IOUT2. The complementary outputs deliver a differential output signal, which improves the dynamic performance through reduction of even-order harmonics, common-mode signals (noise), and double the peak-to-peak output signal swing by a factor of two, as compared to single-ended operation.

The segmented architecture results in a significant reduction of the glitch energy and improves the dynamic performance (SFDR) and DNL. The current outputs maintain a very high output impedance of greater than 300 kΩ.

When pin 42 (GSET) is high (simultaneous gain set mode), the full-scale output current for both DACs is determined by the ratio of the internal reference voltage (1.2 V) and an external resistor (R_{SET}) connected to BIASJ_A. When GSET is low (independent gain set mode), the full-scale output current for each DAC is determined by the ratio of the internal reference voltage (1.2 V) and separate external resistors (R_{SET}) connected to BIASJ_A and BIASJ_B. The resulting I_{REF} is internally multiplied by a factor of 32 to produce an effective DAC output current that can range from 2 mA to 20 mA, depending on the value of R_{SET} .

The DAC5652 is split into a digital and an analog portion, each of which is powered through its own supply pin. The digital section includes edge-triggered input latches and the decoder logic, while the analog section comprises both the current source array with its associated switches, and the reference circuitry.

DAC Transfer Function

Each of the DACs in the DAC5652 has a set of complementary current outputs, IOUT1 and IOUT2. The full-scale output current, I_{OUTFS} , is the summation of the two complementary output currents:

$$I_{OUTFS} = I_{OUT1} + I_{OUT2} \quad (1)$$

The individual output currents depend on the DAC code and can be expressed as:

$$I_{OUT1} = I_{OUTFS} \times \left(\frac{\text{Code}}{1024} \right) \quad (2)$$

$$I_{OUT2} = I_{OUTFS} \times \left(\frac{1023 - \text{Code}}{1024} \right) \quad (3)$$

where Code is the decimal representation of the DAC data input word. Additionally, I_{OUTFS} is a function of the reference current I_{REF} , which is determined by the reference voltage and the external setting resistor (R_{SET}).

$$I_{OUTFS} = 32 \times I_{REF} = 32 \times \frac{V_{REF}}{R_{SET}} \quad (4)$$

In most cases, the complementary outputs drive resistive loads or a terminated transformer. A signal voltage develops at each output according to:

$$V_{OUT1} = I_{OUT1} \times R_{LOAD} \quad (5)$$

$$V_{OUT2} = I_{OUT2} \times R_{LOAD} \quad (6)$$

The value of the load resistance is limited by the output compliance specification of the DAC5652. To maintain specified linearity performance, the voltage for IOUT1 and IOUT2 must not exceed the maximum allowable compliance range.

The total differential output voltage is:

$$V_{\text{OUTDIFF}} = V_{\text{OUT1}} - V_{\text{OUT2}} \quad (7)$$

$$V_{\text{OUTDIFF}} = \frac{(2 \times \text{Code} - 1023)}{1024} \times I_{\text{OUTFS}} \times R_{\text{LOAD}} \quad (8)$$

Analog Outputs

The DAC5652 provides two complementary current outputs, IOUT1 and IOUT2. The simplified circuit of the analog output stage representing the differential topology is shown in Figure 17. The output impedance of IOUT1 and IOUT2 results from the parallel combination of the differential switches, along with the current sources and associated parasitic capacitances.

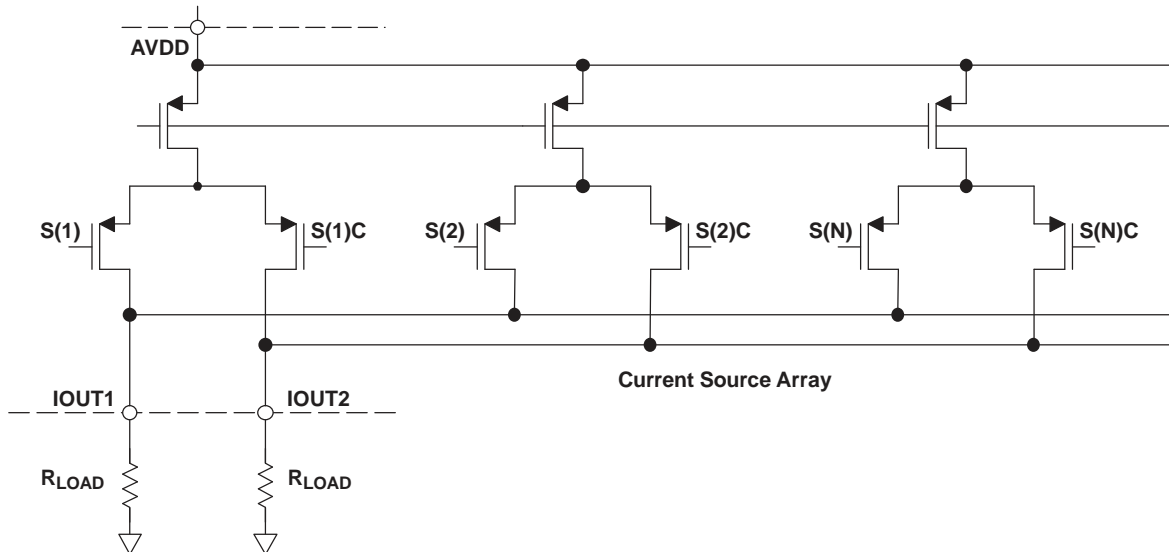

Figure 17. Analog Outputs

The signal voltage swing that may develop at the two outputs, IOUT1 and IOUT2, is limited by a negative and positive compliance. The negative limit of -1 V is given by the breakdown voltage of the CMOS process and exceeding it compromises the reliability of the DAC5652 (or even causes permanent damage). With the full-scale output set to 20 mA, the positive compliance equals 1.2 V. Note that the compliance range decreases to about 1 V for a selected output current of $I_{\text{OUTFS}} = 2$ mA. Care must be taken that the configuration of DAC5652 does not exceed the compliance range to avoid degradation of the distortion performance and integral linearity.

Best distortion performance is typically achieved with the maximum full-scale output signal limited to approximately $0.5 V_{\text{PP}}$. This is the case for a $50\text{-}\Omega$ doubly-terminated load and a 20-mA full-scale output current. A variety of loads can be adapted to the output of the DAC5652 by selecting a suitable transformer while maintaining optimum voltage levels at IOUT1 and IOUT2. Furthermore, using the differential output configuration in combination with a transformer is instrumental for achieving excellent distortion performance. Common-mode errors, such as even-order harmonics or noise, can be substantially reduced. This is particularly the case with high output frequencies.

For those applications requiring the optimum distortion and noise performance, it is recommended to select a full-scale output of 20 mA. A lower full-scale range of 2 mA may be considered for applications that require low power consumption, but can tolerate a slight reduction in performance level.

Output Configurations

The current outputs of the DAC5652 allow for a variety of configurations. As mentioned previously, utilizing the converter's differential outputs yield the best dynamic performance. Such a differential output circuit may consist of an RF transformer or a differential amplifier configuration. The transformer configuration is ideal for most applications with ac coupling, while op amps are suitable for a dc-coupled configuration.

The single-ended configuration may be considered for applications requiring a unipolar output voltage. Connecting a resistor from either one of the outputs to ground converts the output current into a ground-referenced voltage signal. To improve on the dc linearity by maintaining a virtual ground, an I-to-V or op-amp configuration may be considered.

Differential With Transformer

Using an RF transformer provides a convenient way of converting the differential output signal into a single-ended signal while achieving excellent dynamic performance. The appropriate transformer must be carefully selected based on the output frequency spectrum and impedance requirements.

The differential transformer configuration has the benefit of significantly reducing common-mode signals, thus improving the dynamic performance over a wide range of frequencies. Furthermore, by selecting a suitable impedance ratio (winding ratio) the transformer can provide optimum impedance matching while controlling the compliance voltage for the converter outputs.

Figure 18 and Figure 19 show 50-Ω doubly-terminated transformer configurations with 1:1 and 4:1 impedance ratios, respectively. Note that the center tap of the primary input of the transformer has to be grounded to enable a dc-current flow. Applying a 20-mA full-scale output current would lead to a 0.5-V_{PP} output for a 1:1 transformer and a 1-V_{PP} output for a 4:1 transformer. In general, the 1:1 transformer configuration will have slightly better output distortion, but the 4:1 transformer will have 6 dB higher output power.

Figure 18. Driving a Doubly-Terminated 50-Ω Cable Using a 1:1 Impedance Ratio Transformer

Figure 19. Driving a Doubly-Terminated 50-Ω Cable Using a 4:1 Impedance Ratio Transformer

Single-Ended Configuration

Figure 20 shows the single-ended output configuration, where the output current I_{OUT1} flows into an equivalent load resistance of $25\ \Omega$. Node IOUT2 must be connected to AGND or terminated with a resistor of $25\ \Omega$ to AGND. The nominal resistor load of $25\ \Omega$ gives a differential output swing of $1\ V_{PP}$ when applying a 20-mA full-scale output current.

Reference Operation

Internal Reference

The DAC5652 has an on-chip reference circuit which comprises a 1.2-V bandgap reference and two control amplifiers, one for each DAC. The full-scale output current, I_{OUTFS} , of the DAC5652 is determined by the reference voltage, V_{REF} , and the value of resistor R_{SET} . I_{OUTFS} can be calculated by:

$$I_{OUTFS} = 32 \times I_{REF} = 32 \times \frac{V_{REF}}{R_{SET}} \quad (9)$$

The reference control amplifier operates as a V-to-I converter producing a reference current, I_{REF} , which is determined by the ratio of V_{REF} and R_{SET} (see Equation 9). The full-scale output current, I_{OUTFS} , results from multiplying I_{REF} by a fixed factor of 32.

Using the internal reference, a 2-k Ω resistor value results in a full-scale output of approximately 20 mA. Resistors with a tolerance of 1% or better should be considered. Selecting higher values, the output current can be adjusted from 20 mA down to 2 mA. Operating the DAC5652 at lower than 20-mA output currents may be desirable for reasons of reducing the total power consumption, improving the distortion performance, or observing the output compliance voltage limitations for a given load condition.

It is recommended to bypass the EXTIO pin with a ceramic chip capacitor of 0.1 μ F or more. The control amplifier is internally compensated and its small signal bandwidth is approximately 300 kHz.

External Reference

The internal reference can be disabled by simply applying an external reference voltage into the EXTIO pin, which in this case functions as an input. The use of an external reference may be considered for applications that require higher accuracy and drift performance or to add the ability of dynamic gain control.

While a 0.1- μ F capacitor is recommended to be used with the internal reference, it is optional for the external reference operation. The reference input, EXTIO, has a high input impedance (1 M Ω) and can easily be driven by various sources. Note that the voltage range of the external reference must stay within the compliance range of the reference input.

Gain Setting Option

The full-scale output current on the DAC5652 can be set two ways: either for each of the two DAC channels independently or for both channels simultaneously. For the independent gain set mode, the GSET pin (pin 42) must be low (that is, connected to AGND). In this mode, two external resistors are required — one R_{SET} connected to the BIASJ_A pin (pin 44) and the other to the BIASJ_B pin (pin 41). In this configuration, the user has the flexibility to set and adjust the full-scale output current for each DAC independently, allowing for the compensation of possible gain mismatches elsewhere within the transmit signal path.

Alternatively, bringing the GSET pin high (that is, connected to AVDD), the DAC5652 switches into the simultaneous gain set mode. Now the full-scale output current of both DAC channels is determined by only one external R_{SET} resistor connected to the BIASJ_A pin. The resistor at the BIASJ_B pin may be removed; however, this is not required since this pin is not functional in this mode and the resistor has no effect on the gain equation.

Sleep Mode

The DAC5652 features a power-down function which can reduce the total supply current to approximately 3.1 mA over the specified supply range if no clock is present. Applying a logic high to the SLEEP pin initiates the power-down mode, while a logic low enables normal operation. When left unconnected, an internal active pulldown circuit enables the normal operation of the converter.

REVISION HISTORY

| Changes from Revision B (March 2005) to Revision C | Page |
|---|-------------------|
| <ul style="list-style-type: none">Changed the non-printing μ symbols in the Digital Input section of the Electrical Characteristics table (Units column) to the correct μ symbols recognized by the PDF processor. | 7 |

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|
| DAC5652IPFB | ACTIVE | TQFP | PFB | 48 | 250 | Green (RoHS & no Sb/Br) | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | DAC5652I | Samples |
| DAC5652IPFBR | ACTIVE | TQFP | PFB | 48 | 1000 | Green (RoHS & no Sb/Br) | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | DAC5652I | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
