

P3P816711A

Spread Spectrum Peak EMI Reduction Device

Description

P3P816711A generates a 1x LVCMOS low EMI Spread Spectrum clock of the input. The device accepts an AC or DC coupled external clock input at CLKIN. It reduces electromagnetic interference (EMI) at the clock source, allowing system wide reduction of EMI of down stream clock and data dependent signals. It allows significant system cost savings by reducing the number of circuit board layers, ferrite beads, shielding, and other passive components that are traditionally required to pass EMI regulations.

P3P816711A use the most efficient and optimized modulation profile approved by the FCC and is implemented in a proprietary all-digital method.

P3P816711A operates over a V_{DD} range of $3.3\text{ V} \pm 10\%$ and is available in TSOP-6 package over a temperature range of 0°C to $+70^{\circ}\text{C}$. P3I816711A operates over a temperature range of -40°C to $+85^{\circ}\text{C}$.
