DESCRIPTION:

The FST3257 belongs to IDT's family of Bus switches. Bus switch devices perform the function of connecting or isolating two ports without providing any inherent current sink or source

capability. Thus they generate little or no noise of their own while providing a low resistance path for an external driver. These devices connect input and output ports through an n-channel FET. When the gate-to-source junction of this FET is adequately forward-biased the device conducts or the resistance between input and output ports is small. Without adequate bias on the gate-to-source junction of the FET, the FET is turned off, therefore with no Vcc applied, the device has hot insertion capability.

The low on-resistance and simplicity of the connection between input and output ports reduces the delay in this path to close to zero.

The FST3257 provides a 4-bit 2:1 multiplexer/demultiplexer. The S pin controls the mux select and the \bar{E} pin serves as the switch enable.

NOTES:

3257 tbl 07

- See test circuit and waveforms.
- Minimum limits guaranteed but not tested.
- This parameter is guaranteed by design but not tested.
- The bus switch contributes no propagation delay other than the RC delay of the on resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time is constant and much smaller than the rise/fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
- Measured at switch turn off, load = 50 pF in parallel with 10 m Ω scope probe, $V_{IN} = 0.0$ volts.
- Measured at switch turn off through bus multiplexer, (e.g. I₀ to Z => I₁ to Z), load = 50 pF in parallel with 10 M Ω scope probe, V_{IN} at A = 0.0 volts. Charge injection is reduced because the injection from the turn off of the I₀ to Z switch is compensated by the turn on of the I₁ to Z switch.
- Characterized parameter. Not 100% tested.
