
PWM Step-Up DC/DC Controller

NO.EA-088-160113

OUTLINE

The R1211x is a CMOS-based PWM step-up DC/DC converter controller with low supply current. The R1211x consists of an oscillator, a PWM control circuit, a reference voltage unit, an error amplifier, a reference current unit, a protection circuit, and an under voltage lockout (UVLO) circuit. A low ripple and high efficiency step-up DC/DC converter can be configured by only adding few external components, such as an inductor, a diode, a power MOSFET, divider resistors, and capacitors. The R1211x002B/D has a built-in phase compensation, while the R1211x002A/C can set a phase compensation externally. The R1211x002B/D has stand-by mode. The max duty cycle is internally fixed at 90% typically. A soft-start function is built-in, and a soft-starting time is set at 9 ms typically (R1211x002A/B, 700 kHz) or 10.5 ms typically (R1211xC/D, 300 kHz). The R1211x has a latch-type protection circuit, which latches the external driver in off-state if the maximum duty cycle continues for a specified time after soft-starting time. The protection delay time can be set with an external capacitor. To release the protection, turn the power off and back on (power source voltage lower than UVLO detector threshold) or make the device into standby mode and back to active mode using the CE pin.

FEATURES

- Input Voltage Range2.5 V to 6.0 V
- Oscillator Frequency (PWM Control).....300 kHz, 700 kHz
- Maximum Duty Cycle.....Typ. 90%
- Standby CurrentTyp. 0 μ A (R1211x002B/D)
- Feedback Voltage.....1.0 V
- Feedback Voltage Accuracy \pm 1.5%
- UVLO Threshold LevelTyp. 2.2 V (Hysteresis Typ. 0.13 V)
- Feedback Voltage Temperature Coefficient..... \pm 150 ppm/ $^{\circ}$ C
- Built-in Latch-type Protection CircuitProtection delay time can be set with an external capacitor
- PackagesSON-6, SOT-23-6W

APPLICATIONS

- Constant Voltage Power Source for Portable Equipment
- Constant Voltage Power Source for LCD and CCD

SELECTION GUIDE

In the R1211x, the oscillator frequency, the optional function, and the package type are user-selectable options.

Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1211D002x-TR-FE	SON-6	3,000 pcs	Yes	Yes
R1211N002x-TR-FE	SOT-23-6W	3,000 pcs	Yes	Yes

x: Designation of Oscillator Frequency and Optional Function

- (A) 700 kHz, with AMPOUT pin (External Phase Compensation Type)
- (B) 700 kHz, with CE pin (Internal Phase Compensation Type, with Standby)
- (C) 300 kHz, with AMPOUT pin (External Phase Compensation Type)
- (D) 300 kHz, with CE pin (Internal Phase Compensation Type, with Standby)

PIN CONFIGURATIONS

SON-6 Pin Configuration

SOT-23-6W Pin Configuration

PIN DESCRIPTIONS

Pin Descriptions

Symbol	Pin No				Pin Description
	R1211x002A/C		R1211x002B/D		
	SON-6	SOT-23-6W	SON-6	SOT-23-6W	
DELAY	1	1	1	1	Pin for External Capacitor (for Setting Output Delay Time of Protection)
GND	2	5	2	5	Ground Pin
EXT	3	6	3	6	External FET Drive Pin (CMOS Output)
V _{IN}	4	4	4	4	Power Supply Pin
V _{FB}	5	3	5	3	Feedback Pin for Monitoring Output Voltage
AMPOUT	6	2	-	-	Amplifier Output Pin
CE	-	-	6	2	Chip Enable Pin ("H" Active)

* Tab suspension leads in the  parts have GND level. (They are connected to the reverse side of this IC.)
Do not connect to other wires or land patterns.

ABSOLUTE MAXIMUM RATINGS**Absolute Maximum Ratings**

(GND = 0 V)

Symbol	Item	Rating	Unit	
V_{IN}	V_{IN} Pin Voltage	6.5	V	
V_{EXT}	EXT Pin Output Voltage	-0.3 ~ $V_{IN}+0.3$	V	
V_{DLY}	DELAY Pin Voltage	-0.3 ~ $V_{IN}+0.3$	V	
V_{AMP}	AMPOUT Pin Voltage	-0.3 ~ $V_{IN}+0.3$	V	
V_{CE}	CE Pin Input Voltage	-0.3 ~ $V_{IN}+0.3$	V	
V_{FB}	V_{FB} Pin Voltage	-0.3 ~ $V_{IN}+0.3$	V	
I_{AMP}	AMPOUT Pin Current	± 10	mA	
I_{EXT}	EXT Pin Inductor Drive Output Current	± 50	mA	
P_D	Power Dissipation (Standard Land Pattern)*	SOT-23-6W	430	mW

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

R2: Output Voltage Setting Resistor 2

R3: 30 k Ω

[Note] These example circuits may be applied to the output voltage requirement is 15 V or less. If the output voltage requirement is 15 V or more, ratings of NMOS and diode as shown above is over the limit, therefore, choose other external components.

R1211x

NO.EA-088-160113

- Use a 1 μF or more capacitance value of bypass capacitor between VIN pin and GND, C1 as shown in the typical applications above.
 - In terms of the capacitor for setting delay time of the latch protection, C2 as shown in typical applications of the previous page, connect between Delay pin and GND pin of the IC with the minimum wiring distance.
 - Connect a 1 μF or more value of capacitor between VOUT and GND, C3 as shown in typical applications of the previous page. (Recommended value is from 10 μF to 22 μF .) If the operation of the composed DC/DC converter may be unstable, use a tantalum type capacitor instead of ceramic type.
 - Connect a capacitor between VOUT and the dividing point, C4 as shown in typical applications of the previous page. The capacitance value of C4 depends on divider resistors for output voltage setting. Typical value is between 100 pF and 1000 pF.
 - The output voltage can be set with divider resistors for voltage setting, R1 and R2 as shown in typical applications of the previous page. Refer to the next formula.
Output Voltage = $V_{\text{FB}} \times (R1 + R2) / R2$
R1 + R2 = 100 k Ω is recommended range of resistances.
 - The operation of latch protection circuit is as follows: When the IC detects maximum duty cycle, charge to an external capacitor, C2 of DELAY pin starts. And maximum duty cycle continues and the voltage of DELAY pin reaches delay voltage detector threshold, V_{DLY} , outputs "L" to EXT pin and turns off the external power MOSFET. To release the latch protection operation, make the IC be standby mode with CE pin and make it active in terms of R1211x002B/D version. Otherwise, restart with power on.
 - The delay time of latch protection can be calculated with C2, V_{DLY} , and Delay Pin Charge Current, I_{DLY1} , as in the next formula.
 $t = C2 \times V_{\text{DLY}} / I_{\text{DLY1}}$
Once after the maximum duty is detected and released before delay time, charge to the capacitor is halt and delay pin outputs "L".
 - As for R1211x002A/C version, the values and positioning of C4, C5, R3, and R4 shown in the above diagram are just an example combination. These are for making phase compensation. If the spike noise of VOUT may be large, the spike noise may be picked into VFB pin and make the operation unstable. In this case, a resistor R3, shown in typical applications of the previous page. The recommended resistance value of R3 is in the range from 10 k Ω to 50 k Ω . Then, noise level will be decreased.
 - As for R1211x002B/D version, EXT pin outputs GND level at standby mode.
 - Select the Power MOSFET, the diode, and the inductor within ratings (Voltage, Current, Power) of this IC. Choose the power MOSFET with low threshold voltage depending on Input Voltage to be able to turn on the FET completely. Choose the diode with low V_{F} such as Schottky type with low reverse current I_{R} , and with fast switching speed. When an external transistor is switching, spike voltage may be generated caused by an inductor, therefore recommended voltage tolerance of capacitor connected to VOUT is three times of setting voltage or more.
- * The performance of power circuit with using this IC depends on external components. Choose the most suitable components for your application.

OUTPUT CURRENT AND SELECTION OF EXTERNAL COMPONENTS

Basic Circuit

Circuit through L

Discontinuous Mode

Continuous Mode

There are two modes, or discontinuous mode and continuous mode for the PWM step-up switching regulator depending on the continuous characteristic of inductor current.

During on time of the transistor, when the voltage added on to the inductor is described as V_{IN} , the current is $V_{IN} \times t / L$. Therefore, the electric power, P_{ON} , which is supplied with input side, can be described as in next formula.

$$P_{ON} = \int_0^{T_{on}} V_{IN}^2 \times t/L \, dt \dots\dots\dots \text{Formula 1}$$

With the step-up circuit, electric power is supplied from power source also during off time. In this case, input current is described as $(V_{OUT} - V_{IN}) \times t / L$, therefore electric power, P_{OFF} is described as in next formula.

$$P_{OFF} = \int_0^{T_f} V_{IN} \times (V_{OUT} - V_{IN}) \times t/L \, dt \dots\dots\dots \text{Formula 2}$$

In this formula, T_f means the time of which the energy saved in the inductance is being emitted. Thus average electric power, P_{AV} is described as in the next formula.

$$P_{AV} = 1/(T_{ON} + T_{OFF}) \times \left\{ \int_0^{T_{on}} V_{IN}^2 \times t/L \, dt + \int_0^{T_f} V_{IN} \times (V_{OUT} - V_{IN}) \times t/L \, dt \right\} \dots\dots\dots \text{Formula 3}$$

R1211x

NO.EA-088-160113

In PWM control, when $T_f = T_{off}$ is true, the inductor current becomes continuous, then the operation of switching regulator becomes continuous mode.

In the continuous mode, the deviation of the current is equal between on time and off time.

$$V_{IN} \times T_{ON}/L = (V_{OUT} - V_{IN}) \times T_{OFF}/L \dots\dots\dots \text{Formula 4}$$

Further, the electric power, P_{AV} is equal to output electric power, $V_{OUT} \times I_{OUT}$, thus,

$$I_{OUT} = f_{OSC} \times V_{IN}^2 \times T_{ON}^2 / \{2 \times L \times (V_{OUT} - V_{IN})\} = V_{IN}^2 \times T_{ON} / (2 \times L \times V_{OUT}) \dots\dots\dots \text{Formula 5}$$

When I_{OUT} becomes more than formula 5, the current flows through the inductor, then the mode becomes continuous. The continuous current through the inductor is described as I_{CONST} , then,

$$I_{OUT} = f_{OSC} \times V_{IN}^2 \times T_{ON}^2 / \{2 \times L \times (V_{OUT} - V_{IN})\} + V_{IN} \times I_{CONST} / V_{OUT} \dots\dots\dots \text{Formula 6}$$

In this moment, the peak current, I_{LXMAX} flowing through the inductor and the driver T_r is described as follows:

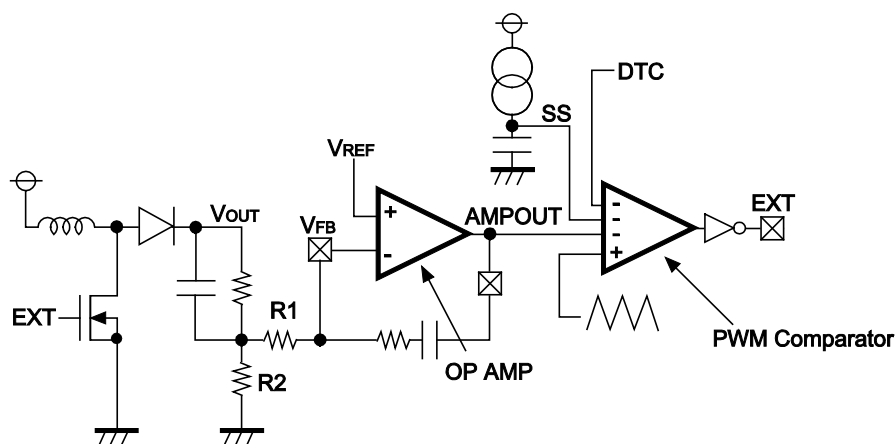

$$I_{LXMAX} = I_{CONST} + V_{IN} \times T_{ON} / L \dots\dots\dots \text{Formula 7}$$

With the formula 4 and 6, I_{LXMAX} is,

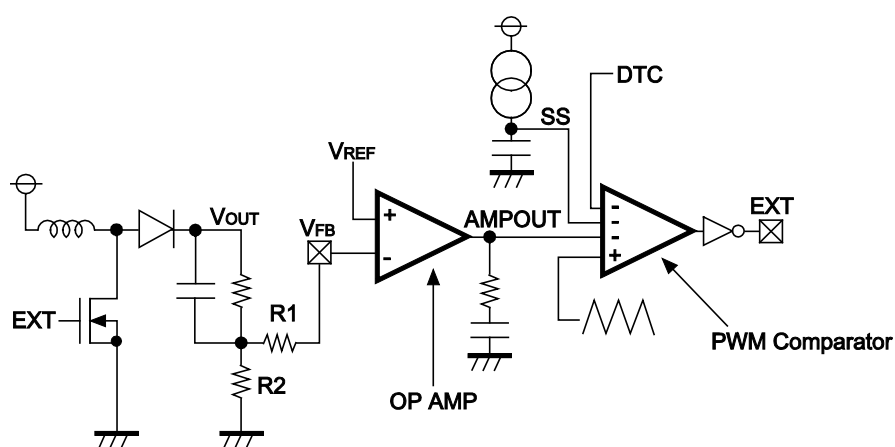

$$I_{LXMAX} = V_{OUT} / V_{IN} \times I_{OUT} + V_{IN} \times T_{ON} / (2 \times L) \dots\dots\dots \text{Formula 8}$$

Therefore, peak current is more than I_{OUT} . Considering the value of I_{LXMAX} , the condition of input and output, and external components should be selected. In the formula 7, peak current I_{LXMAX} at discontinuous mode can be calculated. Put $I_{CONST} = 0$ in the formula. The explanation above is based on the ideal calculation, and the loss caused by L_x switch and external components is not included. The actual maximum output current is between 50% and 80% of the calculation. Especially, when the I_{LX} is large, or V_{IN} is low, the loss of V_{IN} is generated with the on resistance of the switch. As for V_{OUT} , V_f (as much as 0.3 V) of the diode should be considered.

TIMING CHART

R1211x002A/ R1211x002C Timing Chart

R1211x002B/ R1211x002D Timing Chart

Soft-start Operation

Soft-start operation is starting from power-on as follows:

(Step1)

The voltage level of SS is rising gradually by constant current circuit of the IC and a capacitor. V_{REF} level which is input to OP AMP is also gradually rising. V_{OUT} is rising up to input voltage level just after the power-on, therefore, V_{FB} voltage is rising up to the setting voltage with input voltage and the ration of R1 and R2. AMPOUT is at "L", and switching does not start.

(Step2)

When the voltage level of SS becomes the setting voltage with the ration of R1 and R2 or more, switching operation starts. V_{REF} level gradually increases together with SS level. V_{OUT} is also rising with balancing V_{REF} and V_{FB} . Duty cycle depends on the lowest level among AMPOUT, SS, and DTC of the 4 input terminals in the PWM comparator.

(Step3)

When SS reaches 1 V, soft-start operation finishes. V_{REF} becomes constant voltage (= 1 V). Then the switching operation becomes normal mode.

**Latch Protection Operation**

The operation of Latch protection circuit is as follows: When AMPOUT becomes "H" and the IC detects maximum duty cycle, charge to an external capacitor, C2 of DELAY pin starts. And maximum duty cycle continues and the voltage of DELAY pin reaches delay voltage detector threshold, V_{DLY} , outputs "L" to EXT pin and turns off the external power MOSFET. To release the latch protection operation, make the IC be standby mode with CE pin and make it active in terms of R1211x002B/D version. Otherwise, make supply voltage down to UVLO detector threshold or lower, and make it rise up to the normal input voltage. During the soft-start time, if the duty cycle may be the maximum, protection circuit does not work and DELAY pin is fixed at GND level. The delay time of latch protection can be calculated with C2, V_{DLY} , and Delay Pin Charge Current, I_{DLY1} , as in the next formula.

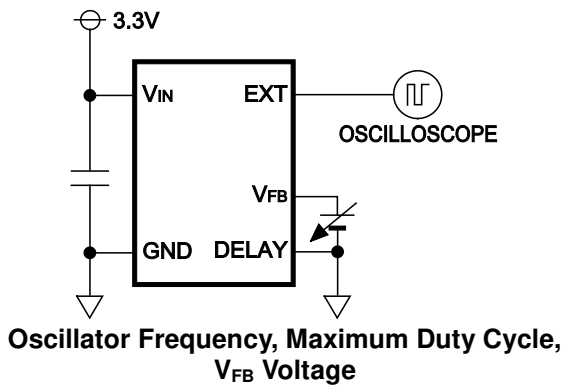

$$t = C2 \times V_{DLY} / I_{DLY1}$$

Once after the maximum duty is detected and released before delay time, charge to the capacitor is halt and delay pin outputs "L".

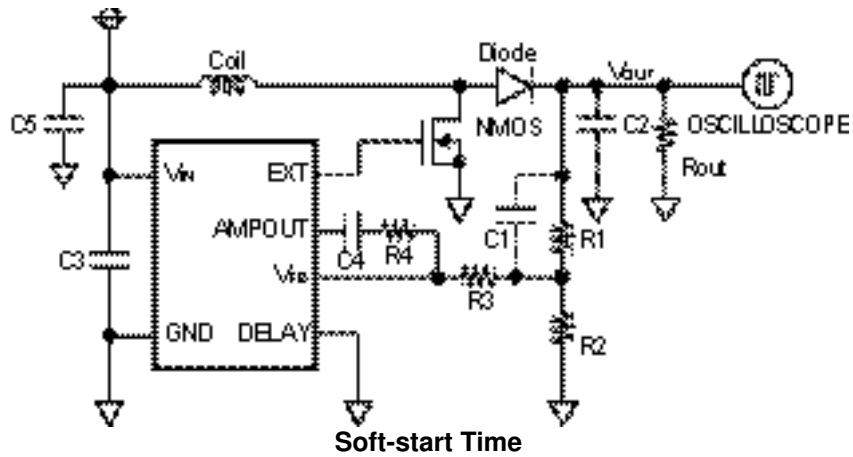

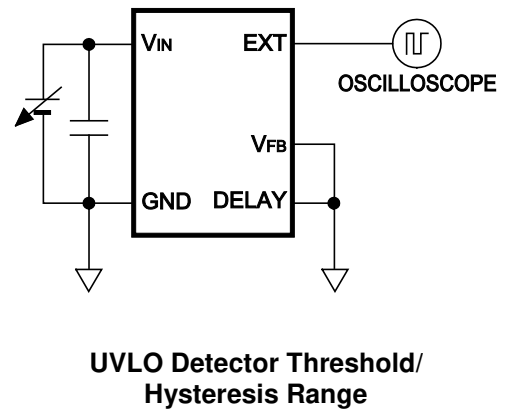

TEST CIRCUITS

R1211x002A/ R1211x002C Test Circuits

R1211x

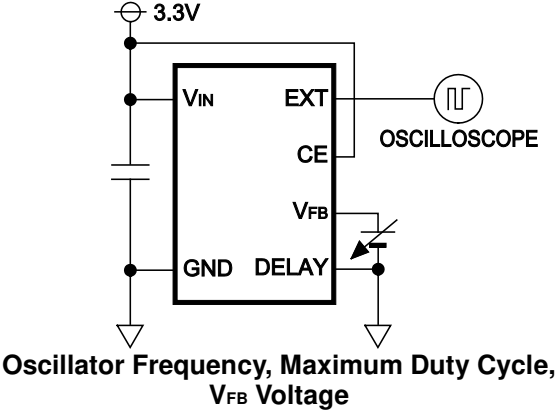

NO.EA-088-160113

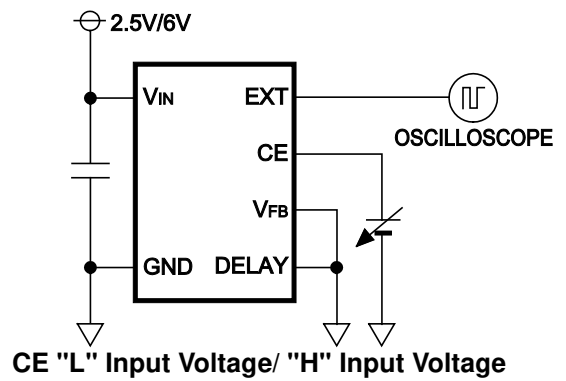

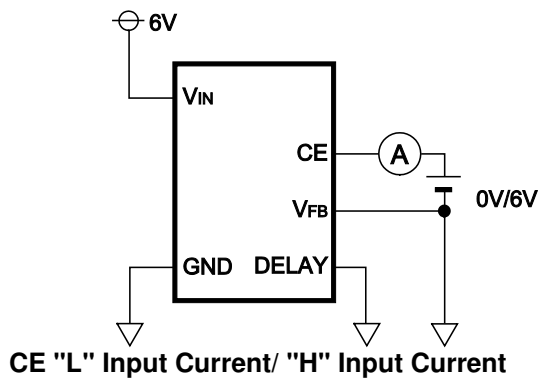

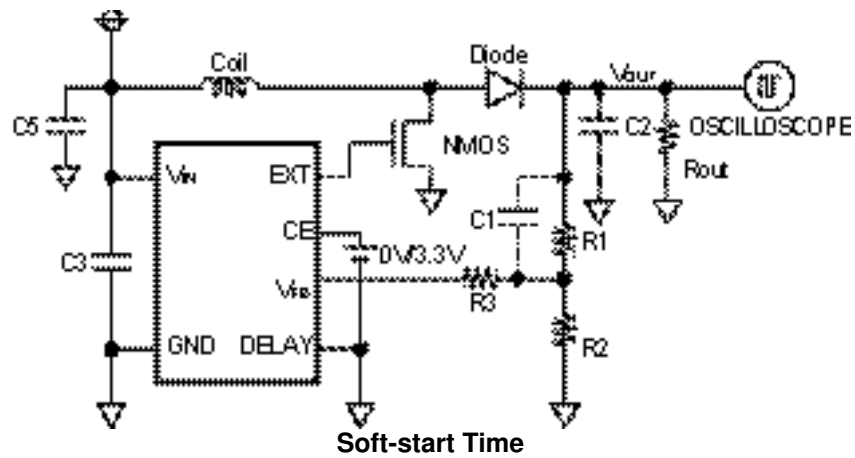

<Components>

- R1: 90 kΩ
- R2: 10 kΩ
- R3: 30 kΩ
- R4: 30 kΩ
- Rout: 1 kΩ/ 330 Ω
- Coil: VLF504012MT-220M (TDK: 22 μH)
- Diode: CRS10I30A (TOSHIBA)
- NMOS: IRF7601 (International Rectifier)
- C1: 680 pF (Ceramic)
- C2: 22 μF (Tantalum) + 2.2 μF (Ceramic)
- C3: 2.2 μF (Ceramic) + 68 μF (Tantalum)
- C4: 2200 pF (Ceramic)
- C5: 22 μF (Tantalum)

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to our sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of our company.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under our company's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact our sales or our distributor before attempting to use AOI.
11. Please contact our sales representatives should you have any questions or comments concerning the products or the technical information.
