

# MAX40007

## nanoPower Op Amp in Ultra-Tiny WLP and SOT23 Packages

### General Description

The MAX40007 is a single operational amplifier that provides a maximized ratio of gain bandwidth (GBW) to supply current and is ideal for battery-powered applications such as portable instrumentation, portable medical equipment, and wireless handsets.

This CMOS op amp features an ultra-low supply current of only 700nA (typ), ground-sensing inputs, and rail-to-rail outputs; operating from a single 1.7V to 5.5V supply, allowing the amplifier to be powered by the same 1.8V, 2.5V, or 3.3V nominal supply that powers the microcontroller. The MAX40007 amplifier is unity-gain stable with a 20kHz GBW product.

The ultra-low supply current, low operating voltage, and rail-to-rail output capabilities make this operational amplifier ideal for use in single lithium ion (Li+), two-cell NiCd or alkaline battery systems.

The MAX40007 is available in a 6-pin SOT23 package and an ultra-tiny 6-bump, 1.1mm x 0.76mm wafer-level package (WLP) with a bump pitch of 0.35mm. The amplifier is specified over the -40°C to 125°C operating temperature range.

### Applications

- Fitness Wearables
- Mobile Phones
- Notebook and Tablet Computers
- Portable Medical Devices
- Portable Instrumentation

### Benefits and Features

- Ultra-Low-Power Preserves Battery Life
  - 700nA Typical Supply Current
- Single 1.7V to 5.5V Supply Voltage Range
  - Amplifier Can be Powered From the Same 1.8V/2.5V/3.3V/5V System Rails
- Tiny Packages Save Board Space
  - 1.1mm x 0.76mm WLP-6 with 0.35mm Bump Pitch
  - SOT23-6 Package
- Precision Specifications for Buffer/Filter/Gain Stages
  - Low 300 $\mu$ V Input Offset Voltage
  - Rail-to-Rail Output Voltage
  - 20kHz BW
  - Low 40pA Input Bias Current
  - Unity-Gain Stable
- -40°C to 125°C Temperature Range

Ordering Information appears at end of data sheet.

**Absolute Maximum Ratings**

V <sub>DD</sub> to V <sub>SS</sub> .....	-0.3V to +6V	Continuous Power Dissipation (T <sub>A</sub> = +70°C)
IN+, IN- to V <sub>SS</sub> .....	V <sub>SS</sub> -0.3V to V <sub>DD</sub> + 0.3V	6-Bump WLP (derate 10.19mW/°C at 70°C).....
IN+ to IN-.....	±V <sub>DD</sub>	SOT23-6 (derate 4.30mW/°C at 70°C).....
OUT to V <sub>SS</sub> .....	V <sub>SS</sub> -0.3V to V <sub>DD</sub> + 0.3V	Operating Temperature Range.....
Continuous Current Into Any Input Pin.....	±10mA	Junction Temperature.....
Continuous Current Into Output Pin.....	±30mA	Storage Temperature Range.....
Output Short-Circuit Duration to V <sub>DD</sub> or V <sub>SS</sub> .....	10s	Lead Temperature (soldering, 10s).....
		Soldering Temperature (reflow).....

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Package Thermal Characteristics (Note 1)**

WLP	Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ).....	98.06°C/W	SOT23	Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ).....	230°C/W
				Junction-to-Case Thermal Resistance (θ <sub>JC</sub> ).....	76°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

**Electrical Characteristics**

V<sub>DD</sub> = +3V, V<sub>SS</sub> = 0V, V<sub>CM</sub> = 0.5V, V<sub>OUT</sub> = V<sub>DD</sub>/2, R<sub>L</sub> = 1MΩ to V<sub>DD</sub>/2, T<sub>A</sub> = +25°C, unless otherwise noted. (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage Range	V <sub>DD</sub>	Guaranteed by PSRR tests	1.7		5.5	V
Supply Current	I <sub>DD</sub>	At 25°C		0.7	0.9	µA
Input Offset Voltage	V <sub>OS</sub>	V <sub>SS</sub> - 0.1V < CMIR < V <sub>DD</sub> - 1.1V		±0.3	±1.3	mV
Input Bias Current (Note 3)	I <sub>B</sub>			±40	±100	pA
Input Offset Current (Note 3)	I <sub>OS</sub>			±5	±50	pA
Input Capacitance		Either input, over entire common mode range		1.5		pF
Input Common-Mode Voltage Range	V <sub>CM</sub>	Guaranteed by the CMRR test	V <sub>SS</sub> - 0.1V		V <sub>DD</sub> - 1.1	V
Common-Mode Rejection Ratio	CMRR	DC, (V <sub>SS</sub> - 0.1) ≤ V <sub>CM</sub> ≤ (V <sub>DD</sub> - 1.1V)	70	92		dB
		AC, 100mV <sub>PP</sub> 1kHz, with output at V <sub>DD</sub> /2		72		
Power-Supply Rejection Ratio	PSRR	DC, +1.7V ≤ V <sub>DD</sub> ≤ +5.5V	75	100		dB
		AC, 100mV <sub>PP</sub> 1kHz, superimposed on V <sub>DD</sub> /2		75		
Large-Signal Voltage Gain	A <sub>VOL</sub>	R <sub>L</sub> = 1MΩ, V <sub>OUT</sub> = V <sub>SS</sub> + 25mV to V <sub>DD</sub> - 25mV	75	110		dB
Output Voltage Swing	V <sub>OH</sub>	Swing high specified as V <sub>DD</sub> - V <sub>OUT</sub>	R <sub>L</sub> = 100kΩ	3.2	8	mV
			R <sub>L</sub> = 10kΩ	32	70	
	V <sub>OL</sub>	Swing low specified as V <sub>OUT</sub> - V <sub>SS</sub>	R <sub>L</sub> = 100kΩ	2.9	8	
			R <sub>L</sub> = 10kΩ	27	70	
Gain-Bandwidth Product	GBW	A <sub>V</sub> = 1, C <sub>L</sub> = 20pF		15		kHz
Phase Margin	φ <sub>M</sub>	C <sub>L</sub> = 20pF		56		°

**Electrical Characteristics (continued)**

$V_{DD} = +3V$ ,  $V_{SS} = 0V$ ,  $V_{CM} = 0.5V$ ,  $V_{OUT} = V_{DD}/2$ ,  $R_L = 1M\Omega$  to  $V_{DD}/2$ ,  $T_A = +25^\circ C$ , unless otherwise noted. (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Slew Rate	SR	$V_{OUT} = 1V_{P-P}$ step, $A_V = 1V/V$		12		V/ms
Settling Time		100mV step, 0.1% settling, $A_V = 1$		74		$\mu s$
Input Voltage Noise	$e_n$	$f = 1kHz$		513		$nV/\sqrt{Hz}$
Input Current Noise	$i_n$	$f = 1kHz$		0.004		$pA/\sqrt{Hz}$

			$R_L = 10k\Omega$	70		

**Note 2:** All devices are production tested at  $T_A = +25^\circ C$ . All temperature limits are guaranteed by design.

**Note 3:** Guaranteed by design and bench characterization.

Typical Operating Characteristics

( $V_{DD} = +3V$ ,  $V_{SS} = 0V$ ,  $V_{CM} = 0V$ ,  $R_L = 100k\Omega$  to  $V_{DD}/2$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

Typical Operating Characteristics (continued)

( $V_{DD} = +3V$ ,  $V_{SS} = 0V$ ,  $V_{CM} = 0V$ ,  $R_L = 100k\Omega$  to  $V_{DD}/2$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

SMALL-SIGNAL PULSE RESPONSE ( $C_{LOAD} = 10pF$ )

SMALL-SIGNAL PULSE RESPONSE ( $C_L = 30pF$ )

SMALL-SIGNAL PULSE RESPONSE ( $C_L = 250pF$ )

LARGE-SIGNAL PULSE RESPONSE ( $C_L = 10pF$ )

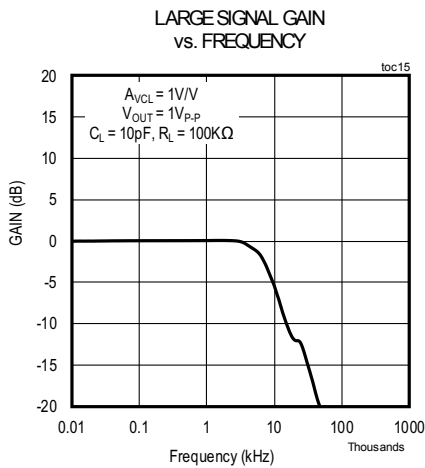

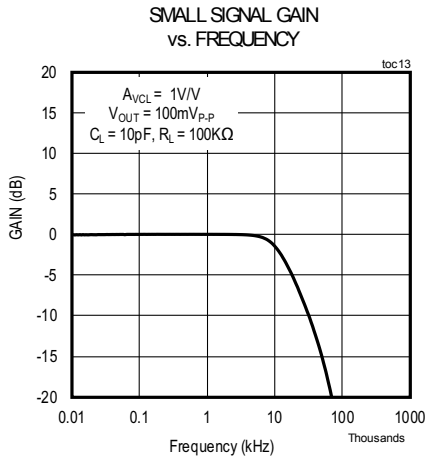

LARGE-SIGNAL PULSE RESPONSE ( $C_L = 30pF$ )

Typical Operating Characteristics (continued)

( $V_{DD} = +3V$ ,  $V_{SS} = 0V$ ,  $V_{CM} = 0V$ ,  $R_L = 100k\Omega$  to  $V_{DD}/2$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

Pin Configurations

Pin Description

BUMP (WLP)	6-SOT23	NAME	FUNCTION
A1	3	IN+	Non-Inverting Amplifier Input.
A2	4	IN-	Inverting Amplifier Input.
A3	1	OUT	Amplifier Output.
B1	5	NC	No Connection. Internally connected.
B2	6	V <sub>DD</sub>	Positive Power Supply Input.
B3	2	V <sub>SS</sub>	Negative Power Supply Input. Connect V <sub>SS</sub> to 0V in single-supply application.

Functional (or Block) Diagram

Detailed Description

The MAX40007 is an ultra-low-power op amp ideal for battery-powered applications and features a maximized ratio of GBW to supply current, low operating supply voltage, and low input bias current. The MAX40007 is ideal for general-purpose, low-current, low-voltage continuously powered portable applications. The MAX40007 consumes an ultra-low 700nA (typ) supply current and has a 0.3mV (typ) offset voltage. This device is unity-gain stable with a 20kHz GBW product, driving capacitive loads up to 20pF.

Applications Information

Ground Sensing

The common-mode input range of the MAX40007 extends down to  $V_{SS}$ , and offers excellent common-mode rejection. This op amp is guaranteed not to exhibit phase reversal when either input is overdriven.

Power Supplies and Layout

The MAX40007 operates from a single +1.7V to +5.5V power supply. Bypass the power supplies with a 0.1μF ceramic capacitor placed close to  $V_{DD}$  and  $V_{SS}$  pins. Adding a solid Ground plane improves performance generally by decreasing the noise at the op amp’s inputs. However, in very high impedance circuits, it may be worth removing the ground plane under the IN- pin to reduce the stray capacitance and help avoid reducing the phase margin. To further decrease stray capacitance, minimize PCB lengths and resistor leads, and place external components close to the amplifier’s pins.

Input Differential Voltage Protection

The MAX40007’s inputs are protected from large differential voltages by the network shown in Figure 1. This is done to prevent gradual degradation of the input offset voltage. In normal operation, the amplifier inputs are at almost the same voltage at all times so these components are transparent to normal operation. Using this amplifier as a comparator, however, is not recommended—the inputs will start to draw “bias current” when the differential voltage exceeds about 1V. While this will not damage the amplifier in any way, it is not usually a desirable feature for a comparator. Maxim does make comparators with similar speed and power performance as these amplifiers, such as the MAX40002/3/4/5.

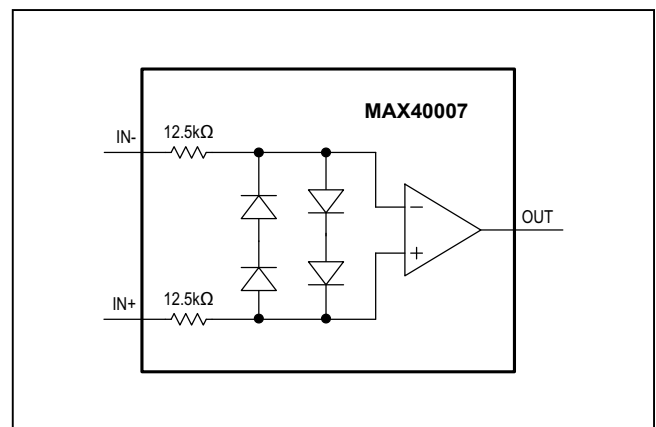

Figure 1. Input Protection Scheme

**Stability**

This MAX40007 maintains stability in its minimum gain configuration while driving capacitive loads up to 20pF or so. Larger capacitive loading is achieved using the techniques described in the Capacitive Load Stability section below.

Although this amplifier is primarily designed for low-frequency applications, good layout can still be extremely important, especially if very high-value resistors are being used—as is likely in ultra-low-power circuitry. However, some stray capacitance may be unavoidable; and it may be necessary to add a 2pF to 10pF capacitor across the feedback resistor, as shown in [Figure 2](#). Select the smallest

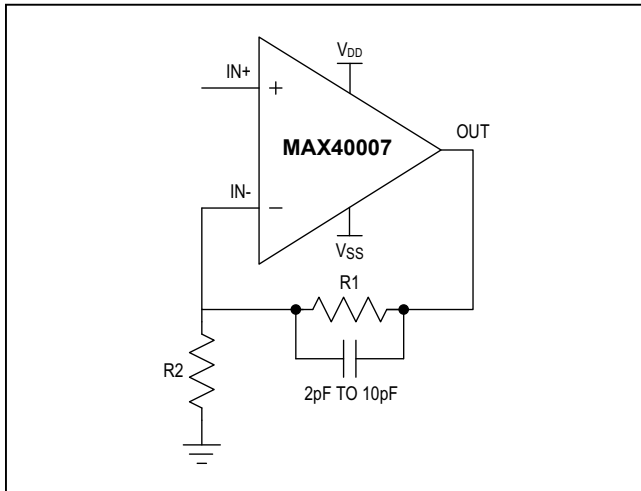

Figure 2. Compensation for Feedback Node Capacitance

capacitor value that ensures stability so that BW and settling time are not significantly impacted.

**Capacitive Load Stability**

Driving large capacitive loads can cause instability in amplifiers. The MAX40007 is stable with capacitive loads up to 20pF. Stability with higher capacitive loads can be achieved by adding an isolation resistor in series with the op-amp output as shown in [Figure 2](#) below. This resistor improves the circuit's phase margin by isolating the load capacitor from the amplifier's inverting input. The graph in the [Typical Operating Characteristics](#) gives the stable operation region for capacitive load versus isolation resistors.
