

General Description

The ICS840021I is a Gigabit Ethernet Clock Generator. The ICS840021I uses a 25MHz crystal to synthesize 125MHz. The ICS840021I has excellent phase jitter performance, over the 1.875MHz – 20MHz integration range. The ICS840021I is packaged in a small 8-pin TSSOP and 16-pin VFQFN, making it ideal for use in systems with limited board space.

Features

- One LVCMOS/LVTTL output, 15Ω output impedance
- Crystal oscillator interface designed for 25MHz, 18pF parallel resonant crystal
- Output frequency: 125MHz
- VCO range: 560MHz to 680MHz
- RMS phase jitter @ 125MHz, using a 25MHz crystal (1.875MHz - 20MHz): 0.48ps (typical) 3.3V
- RMS phase noise at 125MHz (typical)
- Phase noise:

Offset	Noise Power
100Hz	-97.8 dBc/Hz
1kHz	-124.6 dBc/Hz
10kHz	-132.5 dBc/Hz
100Hz	-131.1 dBc/Hz

- Voltage Supply Modes:
V_{DD}/V_{DDA} = 3.3V
V_{DD}/V_{DDA} = 2.5V
- -40°C to 85°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

Block Diagram

Table 1. Pin Descriptions

Name	Type		Description
V _{DDA}	Power		Analog supply pin.
OE	Input	Pullup	Output enable pin. When HIGH, Q0 output is enabled. When LOW, forces Q0 to high-impedance state. LVCMOS/LVTTL interface levels.
XTAL_OUT, XTAL_IN	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.
nc	Unused		No connect.
RESERVED	Reserved		Reserved pin.
GND	Power		Power supply ground.
Q0	Output		Single-ended clock output. LVCMOS/LVTTL interface levels. 15Ω output impedance.
V _{DD}	Power		Core supply pin.

NOTE: *Pullup* refers to internal input resistors. See Table 1, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
C _{PD}	Power Dissipation Capacitance	V _{DD} = 3.465V		7		pF
		V _{DD} = 2.625V		7		pF
R _{PULLUP}	Input Pullup Resistor			51		kΩ
R _{OUT}	Output Impedance			15		Ω

Function Table

Table 3. Control Function Table

Control Input	Output
OE	Q0
0	High-Impedance
1	Active

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond

those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_O	-0.5V to $V_{DD} + 0.5V$
Package Thermal Impedance, θ_{JA} 8 TSSOP 16 VFQFN	101.7°C/W (0 mps) 74.9°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = 3.3V \pm 5\%$, $T_A = -40^\circ\text{C}$ to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{DD}	Core Supply Voltage		3.135	3.3	3.465	V
V_{DDA}	Analog Supply Voltage		3.135	3.3	3.465	V
I_{DD}	Power Supply Current				65	mA
I_{DDA}	Analog Supply Current				10	mA

Application Information

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. ICS840021I provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} and V_{DDA} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{DDA} pin.

Figure 1. Power Supply Filtering

Crystal Input Interface

The ICS840021I has been characterized with 18pF parallel resonant crystals. The capacitor values, $C1$ and $C2$, shown in *Figure 2* below were determined using a 25MHz , 18pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum $C1$ and $C2$ values can be slightly adjusted for different board layouts.

Figure 2. Crystal Input Interface

LVCMOS to XTAL Interface

The XTAL_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVCMOS signals, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver (R_o) plus the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50Ω applications, R_1 and R_2 can be 100Ω . This can also be accomplished by removing R_1 and making R_2 50Ω .

Figure 3. General Diagram for LVCMOS Driver to XTAL Input Interface

Application Schematic

Figure 4A shows a schematic example of the ICS840021I. An example of LVCMOS termination is shown in this schematic. Additional LVCMOS termination approaches are shown in the LVCMOS Termination Application Note. In this example, an 18pF

parallel resonant 25MHz crystal is used for generating 125MHz output frequency. The C1 = 22pF and C2 = 33pF are recommended for frequency accuracy. For different board layout, the C1 and C2 values may be slightly adjusted for optimizing frequency accuracy.

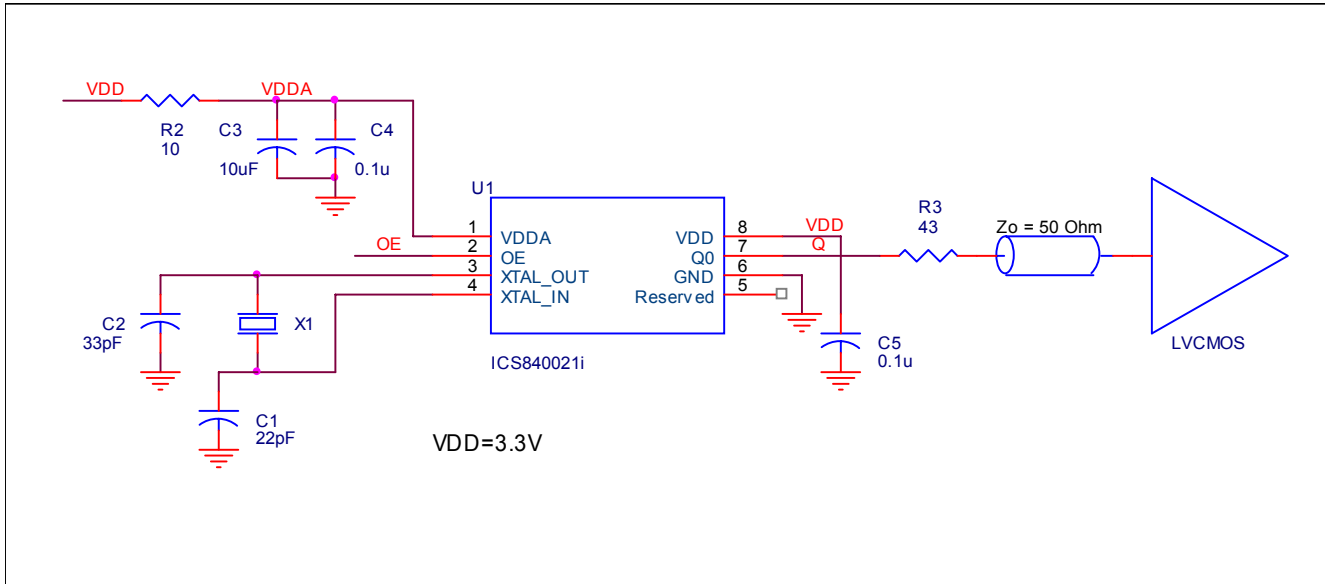

Figure 4A. ICS840021I Schematic Example

PC BOARD LAYOUT EXAMPLE

Figure 4B shows an example of ICS840021I P.C. board layout. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed in the Table 7. There

should be at least one decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane.

Table 7. Footprint Table

Reference	Size
C1, C2	0402
C3	0805
C4, C5	0603
R2, R3	0603

NOTE: Table 7, lists component sizes shown in this layout example.
