

Features

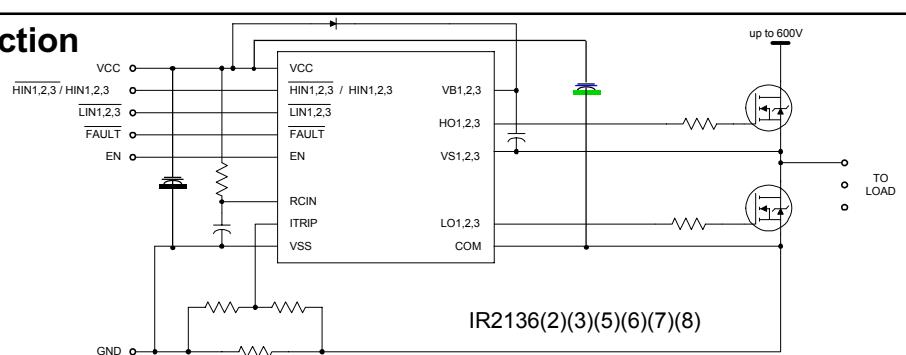

- Floating channel designed for bootstrap operation
Fully operational to +600V
Tolerant to negative transient voltage - dV/dt immune
- Gate drive supply range from 10 to 20V (IR2136/IR21368),
11.5 to 20V (IR21362) or 12 to 20V (IR21363/IR21365/
IR21366/IR21367)
- Undervoltage lockout for all channels
- Over-current shutdown turns off all six drivers
- Independent 3 half-bridge drivers
- Matched propagation delay for all channels
- Cross-conduction prevention logic
- Lowside outputs out of phase with inputs. High side
outputs out of phase (IR2136/IR21363/IR21365/
IR21366/IR21367/IR21368) or in phase
(IR21362) with inputs.
- 3.3V logic compatible
- Lower di/dt gate driver for better noise immunity
- Externally programmable delay for automatic fault clear
- Also available LEAD-FREE

Description

The IR2136/IR21362/IR21363/IR21365/IR21366/IR21367/IR21368(J&S) are high voltage, high speed power MOSFET and IGBT drivers with three independent high and low side referenced output channels for 3-phase applications. Proprietary HVIC technology enables ruggedized monolithic construction. Logic inputs are compatible with CMOS or LSTTL outputs, down to 3.3V logic. A current trip function which terminates all six outputs can be derived from an external current sense resistor. An enable function is available to terminate all six outputs simultaneously. An open-drain FAULT signal is provided to indicate that an overcurrent or undervoltage shutdown has occurred. Overcurrent fault conditions are cleared automatically after a delay programmed externally via an RC network connected to the RCIN input. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction. Propagation delays are matched to simplify use in high frequency applications. The floating channel can be used to drive N-channel power MOSFETs or IGBTs in the high side configuration which operates up to 600 volts.

Absolute Maximum Ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

Symbol	Definition	Min.	Max.	Units
V_S	High side offset voltage	$V_{B1,2,3} - 25$	$V_{B1,2,3} + 0.3$	V

Symbol	Description
VCC	Low side and logic fixed supply
VSS	Logic Ground
HIN1,2,3	Logic inputs for high side gate driver outputs (HO1,2,3), out of phase (IR2136/IR21363(5)(6)(7)(8))
HIN1,2,3	Logic inputs for high side gate driver outputs (HO1,2,3), in phase (IR21362)
LIN1,2,3	Logic inputs for low side gate driver outputs (LO1,2,3), out of phase
FAULT	Indicates over-current (ITRIP) or low-side undervoltage lockout has occurred. Negative logic, open-drain output
EN	Logic input to enable I/O functionality. Positive logic, i.e. I/O logic functions when ENABLE is high. No effect on FAULT and not latched
ITRIP	Analog input for overcurrent shutdown. When active, ITRIP shuts down outputs and activates FAULT and RCIN low. When ITRIP becomes inactive, FAULT stays active low for an externally set time T_{FLTCLR} , then automatically becomes inactive (open-drain high impedance).
RCIN	External RC network input used to define FAULT CLEAR delay, T_{FLTCLR} , approximately equal to $R*C$. When $RCIN > 8V$, the FAULT pin goes back into open-drain high-impedance
COM	Low side gate driver return
V _B 1,2,3	High side floating supply
HO1,2,3	High side gate driver outputs
V _S 1,2,3	High voltage floating supply returns
LO1,2,3	Low side gate driver output

Note: All input pins and the ITRIP pin are internally clamped with a 5.2V zener diode.
