## **1/8 to 1/10 Duty LCD Display Driver with Key Input Function**

### **Overview**

The LC75808W is 1/8 to 1/10 duty LCD display driver that can directly drive up to 600 segments and can control up to four general-purpose output ports. This product also incorporates a key scan circuit that accepts input from up to 30 keys to reduce printed circuit board wiring.

### **Features**

- Key input function for up to 30 keys (A key scan is performed only when a key is pressed.)
- 1/8duty-1/4bias, 1/9duty-1/4bias, and 1/10duty-1/4bias drive schemes can be controlled from serial data.
  - 1/8duty-1/4bias: up to 480 segments
  - 1/9duty-1/4bias: up to 540 segments
  - 1/10duty-1/4bias: up to 600 segments
- Sleep mode and all segments off functions that are controlled from serial data.
- Serial data I/O supports CCB format communication with the system controller.
- Direct display of display data without the use of a decoder provides high generality.
- Built-in display contrast adjustment circuit.
- Up to 4 general-purpose output ports are included.
- Independent LCD driver block power supply  $V_{LCD}$ .
- Provision of an on-chip voltage-detection type reset circuit prevents incorrect displays.
- The INH pin is provided. This pin turns off the display, disables key scanning, and forces the general-purpose output ports to the low level.
- RC oscillator circuit.

- CCB is ON Semiconductor®'s original format. All addresses are managed by ON Semiconductor® for this format.

- CCB is a registered trademark of Semiconductor Components Industries, LLC.

## Specifications

**Absolute Maximum Ratings** at Ta = 25°C, VSS = 0V

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V <sub>DD</sub> max	V <sub>DD</sub>	-0.3 to +7.0	V
	V <sub>LCD</sub> max	V <sub>LCD</sub>	-0.3 to +12.0	
Input voltage	V <sub>IN1</sub>	CE, CL, DI, $\overline{\text{INH}}$	-0.3 to +7.0	V
	V <sub>IN2</sub>	OSC, KI1 to KI5, TEST	-0.3 to V <sub>DD</sub> +0.3	
	V <sub>IN3</sub>	V <sub>LCD1</sub> , V <sub>LCD2</sub> , V <sub>LCD3</sub> , V <sub>LCD4</sub>	-0.3 to V <sub>LCD</sub> +0.3	
Output voltage	V <sub>OUT1</sub>	DO	-0.3 to +7.0	V
	V <sub>OUT2</sub>	OSC, KS1 to KS6, P1 to P4	-0.3 to V <sub>DD</sub> +0.3	
	V <sub>OUT3</sub>	V <sub>LCD0</sub> , S1 to S6, COM1 to COM10	-0.3 to V <sub>LCD</sub> +0.3	
Output current	I <sub>OUT1</sub>	S1 to S6	300	μA
	I <sub>OUT2</sub>	COM1 to COM10	3	mA
	I <sub>OUT3</sub>	KS1 to KS6	1	
	I <sub>OUT4</sub>	P1 to P4	5	
Allowable power dissipation	Pd max	Ta=85°C	200	mW
Operating temperature	Topr		-40 to +85	°C
Storage temperature	Tstg		-55 to +125	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

**Allowable Operating Ranges** at Ta = -40 to +85°C, VSS = 0V

Parameter	Symbol	Conditions	Ratings			unit
			min	typ	max	
Supply voltage	V <sub>DD</sub>	V <sub>DD</sub>	4.5		6.0	V
	V <sub>LCD</sub>	V <sub>LCD</sub> . When the display contrast adjustment circuit is used	7.0		11.0	
	V <sub>LCD</sub>	V <sub>LCD</sub> . When the display contrast adjustment circuit is not used	4.5		11.0	
Output voltage	V <sub>LCD0</sub>	V <sub>LCD0</sub>	V <sub>LCD4</sub> +4.5		V <sub>LCD</sub>	V
Input voltage	V <sub>LCD1</sub>	V <sub>LCD1</sub>		3/4(V <sub>LCD0</sub> -V <sub>LCD4</sub> )	V <sub>LCD0</sub>	V
	V <sub>LCD2</sub>	V <sub>LCD2</sub>		2/4(V <sub>LCD0</sub> -V <sub>LCD4</sub> )	V <sub>LCD0</sub>

## Electrical Characteristics for the Allowable Operating Ranges

Parameter	Symbol	Conditions	Ratings			unit
			min	typ	max	
Hysteresis	$V_H$	CE, CL, DI, $\overline{INH}$ , KI1 to KI5		0.1 $V_{DD}$		V
Power-down detection voltage	$V_{DET}$		2.5	3.0	3.5	V
Input high level current	$I_{IH}$	CE, CL, DI, $\overline{INH}$ : $V_I=6.0V$			5.0	$\mu A$
Input low level current	$I_{IL}$	CE, CL, DI, $\overline{INH}$ : $V_I=0V$	-5.0			$\mu A$
Input floating voltage	$V_{IF}$	KI1 to KI5			0.05 $V_{DD}$	V
Pull-down resistance	$R_{PD}$	KI1 to KI5: $V_{DD}=5.0V$	50	100	250	$k\Omega$
Output off leakage current	$I_{OFFH}$	DO: $V_O=6.0V$			6.0	$\mu A$
Output high level voltage	$V_{OH1}$	S1 to S60: $I_O=-20\mu A$	$V_{LCD0}-0.6$			V
	$V_{OH2}$	COM1 to COM10: $I_O=-100\mu A$	$V_{LCD0}-0.6$			
	$V_{OH3}$	KS1 to KS6: $I_O=-500\mu A$	$V_{DD}-1.0$	$V_{DD}-0.5$	$V_{DD}-0.2$	
	$V_{OH4}$	P1 to P4: $I_O=-1mA$	$V_{DD}-1.0$			
Output low level voltage	$V_{OL1}$	S1 to S60: $I_O=20\mu A$			$V_{LCD4}+0.6$	V
	$V_{OL2}$	COM1 to COM10: $I_O=100\mu A$			$V_{LCD4}+0.6$	
	$V_{OL3}$	KS1 to KS6: $I_O=25\mu A$	0.2	0.5	1.5	
	$V_{OL4}$	P1 to P4: $I_O=1mA$			1.0	
	$V_{OL5}$	DO: $I_O=1mA$		0.1	0.5	
Output middle level voltage *2	$V_{MID1}$	S1 to S60: $I_O=\pm 20\mu A$	$\frac{2}{4}(V_{LCD0}-V_{LCD4})-0.6$		$\frac{2}{4}(V_{LCD0}-V_{LCD4})+0.6$	V
	$V_{MID2}$	COM1 to COM10: $I_O=\pm 100\mu A$	$\frac{3}{4}(V_{LCD0}-V_{LCD4})-0.6$		$\frac{3}{4}(V_{LCD0}-V_{LCD4})+0.6$	
	$V_{MID3}$	COM1 to COM10: $I_O=\pm 100\mu A$	$\frac{1}{4}(V_{LCD0}-V_{LCD4})-0.6$		$\frac{1}{4}(V_{LCD0}-V_{LCD4})+0.6$	
Oscillator frequency	$f_{OSC}$	OSC: $R_{OSC}=43k\Omega$ , $C_{OSC}=680pF$	40	50	60	kHz
Current drain	$I_{DD1}$	$V_{DD}$ : Sleep mode			100	$\mu A$
	$I_{DD2}$	$V_{DD}$ : $V_{DD}=6.0V$ , outputs open, $f_{OSC}=50kHz$		250	500	
	$I_{LCD1}$	$V_{LCD}$ : Sleep mode			5	
	$I_{LCD2}$	$V_{LCD}$ : $V_{LCD}=11.0V$ , Outputs open, $f_{OSC}=50kHz$ (When the display contrast adjustment circuit is used.)		500	1000	
	$I_{LCD3}$	$V_{LCD}$ : $V_{LCD}=11.0V$ , Outputs open, $f_{OSC}=50kHz$ (When the display contrast adjustment circuit is not used.)		250	500	

Note: \*2 Excluding the bias voltage generation divider resistor built into  $V_{LCD0}$ ,  $V_{LCD1}$ ,  $V_{LCD2}$ ,  $V_{LCD3}$ , and  $V_{LCD4}$ . (See Figure 1.)

## Pin Functions

Symbol	Pin No.	Function	Active	I/O	Handling when unused
S1 to S60	1 to 60	Segment driver outputs.	-	O	OPEN
COM1 to COM10	70 to 61	Common driver outputs.	-	O	OPEN
KS1 to KS6	71 to 76	Key scan outputs. Although normal key scan timing lines require diodes to be inserted in the timing lines to prevent shorts, since these outputs are unbalanced CMOS transistor outputs, these outputs will not be damaged by shorting when these outputs are used to form a key matrix.	-	O	OPEN
KI1 to KI5	77 to 81	Key scan inputs. These pins have built-in pull-down resistors.	H	I	GND
P1 to P4	82 to 85	General-purpose output ports.	-	O	OPEN
OSC	95	Oscillator connection. An oscillator circuit is formed by connecting an external resistor and capacitor at this pin.	-	I/O	V <sub>DD</sub>
CE	98	Serial data interface connections to the controller. Note that DO, being an open-drain output, requires a pull-up resistor. CE: Chip enable CL: Synchronization clock DI: Transfer data DO: Output data	H	I	GND
CL	99			I	
DI	100		-	I	
DO	97		-	O	OPEN
$\overline{\text{INH}}$	96	Input that turns the display off, disables key scanning, and forces the general-purpose output ports low. • When $\overline{\text{INH}}$ is low (V <sub>SS</sub> ): • Display off S1 to S60 = "L" (V <sub>LCD4</sub> ). COM1 to COM10 = "L" (V <sub>LCD4</sub> ). • General-purpose output ports P1 to P4 = low (V <sub>SS</sub> ) • Key scanning is disabled: KS1 to KS6 = low (V <sub>SS</sub> ) • All the key data is reset to low. • When $\overline{\text{INH}}$ is high (V <sub>DD</sub> ): • Display on • The states of the general-purpose output ports can be set by the PC1 to PC4 control data. • Key scanning is enabled. However, serial data can be transferred when the $\overline{\text{INH}}$ pin is low.	L	I	V <sub>DD</sub>
TEST	94	This pin must be connected to ground.	-	I	-
V <sub>LCD0</sub>	88	LCD drive 4/4 bias voltage (high level) supply pin. The level on this pin can be changed by the display contrast adjustment circuit. However, (V <sub>LCD0</sub> - V <sub>LCD4</sub> ) must be greater than or equal to 4.5V. Also, external power must not be applied to this pin since the pin circuit includes the display contrast adjustment circuit.	-	O	OPEN
V <sub>LCD1</sub>	89	LCD drive 3/4 bias voltage (middle level) supply pin. This pin can be used to supply the 3/4 (V <sub>LCD0</sub> - V <sub>LCD4</sub> ) voltage level externally.	-	I	OPEN
V <sub>LCD2</sub>	90	LCD drive 2/4 bias voltage (middle level) supply pin. This pin can be used to supply the 2/4 (V <sub>LCD0</sub> - V <sub>LCD4</sub> ) voltage level externally.	-	I	OPEN
V <sub>LCD3</sub>	91	LCD drive 1/4 bias voltage (middle level) supply pin. This pin can be used to supply the 1/4 (V <sub>LCD0</sub> - V <sub>LCD4</sub> ) voltage level externally.	-	I	OPEN
V <sub>LCD4</sub>	92	LCD drive 0/4 bias voltage (low level) supply pin. Fine adjustment of the display contrast can be implemented by connecting an external variable resistor to this pin. However, (V <sub>LCD0</sub> - V <sub>LCD4</sub> ) must be greater than or equal to 4.5V, and V <sub>LCD4</sub> must be in the range 0 V to 1.5V, inclusive.	-	I	GND
V <sub>DD</sub>	86	Logic block power supply connection. Provide a voltage of between 4.5 and 6.0V.	-	-	-
V <sub>LCD</sub>	87	LCD driver block power supply connection. Provide a voltage of between 7.0 and 11.0V when the display contrast adjustment circuit is used and provide a voltage of between 4.5 and 11.0V when the circuit is not used.	-	-	-
V <sub>SS</sub>	93	Power supply connection. Connect to ground.	-	-	-

## Control Data Functions

### 1. KC1 to KC6: Key scan output state setting data

These control data bits set the states of the key scan output pins KS1 to KS6.

Output pin	KS1	KS2	KS3	KS4	KS5	KS6
Key scan output state setting data	KC1	KC2	KC3	KC4	KC5	KC6

For example, if KC1 to KC3 are set to 1, and KC4 to KC6 are set to 0, then the output pins KS1 to KS3 will output high levels ( $V_{DD}$ ) and the output pins KS4 to KS6 will output low levels ( $V_{SS}$ ) in the key scan standby state.

Note that key scan output signal is not output from output pins that are set low.

### 2. PC1 to PC4: General-purpose output port state setting data

These control data bits set the states of the general-purpose output ports P1 to P4.

Output pin	P1	P2	P3	P4
General-purpose output port state setting data	PC1	PC2	PC3	PC4

For example, if PC1 and PC2 are set to 1, and PC3 and PC4 are set to 0, then the output pins P1 and P2 will output high levels ( $V_{DD}$ ) and the output pins P3 and P4 will output low levels ( $V_{SS}$ ).

### 3. CT0 to CT3, CTC: Display contrast setting data

These control data bits set the display contrast.

CT0 to CT3: Display contrast setting (11 steps)

CT0	CT1	CT2	CT3	LCD drive 4/4 bias voltage supply $V_{LCD0}$ level
0	0	0	0	$0.94V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 2)$
1	0	0	0	$0.91V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 3)$
0	1	0	0	$0.88V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 4)$
1	1	0	0	$0.85V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 5)$
0	0	1	0	$0.82V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 6)$
1	0	1	0	$0.79V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 7)$
0	1	1	0	$0.76V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 8)$
1	1	1	0	$0.73V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 9)$
0	0	0	1	$0.70V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 10)$
1	0	0	1	$0.67V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 11)$
0	1	0	1	$0.64V_{LCD}=V_{LCD}-(0.03V_{LCD}\times 12)$

### CTC: Display contrast adjustment circuit state setting

CTC	Display contrast adjustment circuit state
0	The display contrast adjustment circuit is disabled, and the $V_{LCD0}$ pin level is forced to the $V_{LCD}$ level.
1	The display contrast adjustment circuit operates and the display contrast is adjusted.

Note that although the display contrast can be adjusted by operating the built-in display contrast adjustment circuit, it is also possible to apply fine adjustments to the contrast by connecting an external variable resistor to the  $V_{LCD4}$  pin and modifying the  $V_{LCD4}$  pin voltage. However, the following conditions must be met:  $(V_{LCD0} - V_{LCD4}) \geq 4.5V$ , and  $1.5V \geq V_{LCD4} \geq 0V$ .

#### 4. SC: Segment on/off control data

This control data bit controls the on/off state of the segments.

SC	Display state
0	On
1	Off

However, note that when the segments are turned off by setting SC to 1, the segments are turned off by outputting segment off waveforms from the segment output pins.

#### 5. SP: Normal mode/sleep mode control data

This control data bit controls the normal mode and sleep mode.

BU	Mode
0	Normal mode
1	Sleep mode The common and segment pins go to the $V_{LCD4}$ level and the oscillator on the OSC pin is stopped (although it operates during key scan operations) to reduce current drain. Note that the states of the general-purpose output ports P1 to P4 are set by PC1 to PC4 in the control data during sleep mode as well as normal mode.

#### 6. DT1, DT2: Display technique setting data

These control data bits set the display technique.

DT1	DT2	Display technique	Output pins	
			COM9	COM10
0	0	1/8 duty 1/4 bias drive	Fixed at the $V_{LCD4}$ level	Fixed at the $V_{LCD4}$ level
1	0	1/9 duty 1/4 bias drive	COM9	Fixed at the $V_{LCD4}$ level
0	1	1/10 duty 1/4 bias drive	COM9	COM10

Note: COMn (n = 9 or 10): Common outputs

**Serial Data Output**

1. When CL is stopped at the low level

2. When CL is stopped at the high level

Note: B0 to B3, A0 to A3..... CCB address '43H'  
 KD1 to KD30 ..... Key data  
 SA ..... Sleep acknowledge data

Note: If a key data read operation is executed when DO is high, the read key data (KD1 to KD30) and sleep acknowledge data(SA) will be invalid.

**Output Data**

1. KD1 to KD30: Key data

When a key matrix of up to 30 keys is formed from the KS1 to KS6 output pins and the KI1 to KI5 input pins and one of those keys is pressed, the key output data corresponding to that key will be set to 1. The table shows the relationship between those pins and the key data bits.

	KI1	KI2	KI3	KI4	KI5
KS1	KD1	KD2	KD3	KD4	KD5
KS2	KD6	KD7	KD8	KD9	KD10
KS3	KD11	KD12	KD13	KD14	KD15
KS4	KD16	KD17	KD18	KD19	KD20
KS5	KD21	KD22	KD23	KD24	KD25
KS6	KD26	KD27	KD28	KD29	KD30

When the states of the KS1 to KS6 output pins during key scan standby are set to low for KS1 and KS2 and to high for KS3 to KS6 by the KC1 to KC6 bits in the control data and a key matrix of up to 20 keys is formed from the KS3 to KS6 output pins and the KI1 to KI5 input pins, the KD1 to KD10 key data bits will be set to 0.

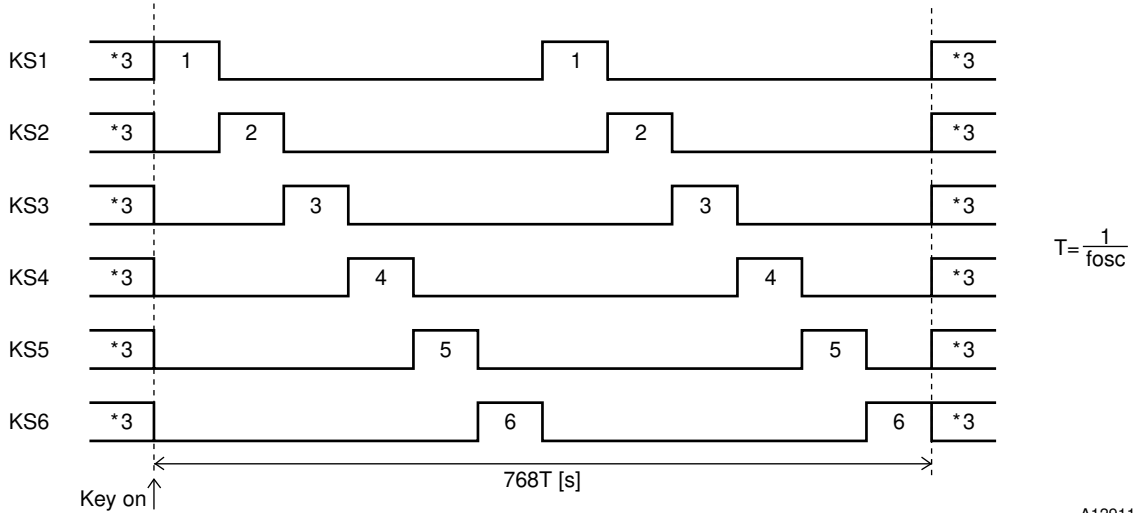

2. SA: Sleep acknowledge data

This output data bit is set to the state when the key was pressed. Also, while DO will be low in this case, if serial data is input and the mode is set (to normal or sleep mode) during this period, that mode will be set. SA will be 1 in sleep mode and 0 in normal mode.

## Key Scan Operation Functions

### 1. Key scan timing

The key scan period is 384T(s). To reliably determine the on/off state of the keys, the LC75808W scans the keys twice and determines that a key has been pressed when the key data agrees. It outputs a key data read request (a low level on DO) 800T(s) after starting a key scan. If the key data dose not agree and a key was pressed at that point, it scans the keys again. Thus the LC75808W cannot detect a key press shorter than 800T(s).

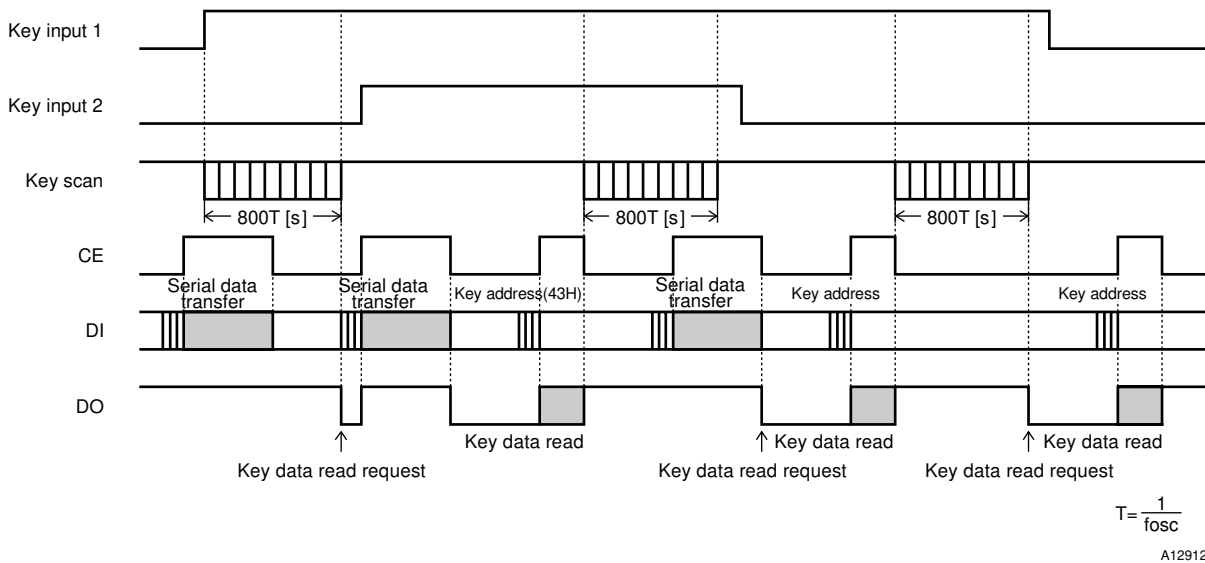

A12911

Note: \*3. Note that the high/low states of these pins are determined by the KC1 to KC6 bits in the control data, and that key scan output signals are not output from pins that are set to low.

### 2. In normal mode

- The pins KS1 to KS6 are set to high or low by the KC1 to KC6 bits in the control data.
- If a key on one of the lines corresponding to a KS1 to KS6 pin which is set high is pressed, a key scan is started and the keys are scanned until all keys are released. Multiple key presses are recognized by determining whether multiple key data bits are set.
- If a key is pressed for longer than 800T(s) (Where  $T = \frac{1}{f_{OSC}}$ ) the LC75808W outputs a key data read request (a low level on DO) to the controller. The controller acknowledges this request and reads the key data. However, if CE is high during a serial data transfer, DO will be set high.
- After the controller reads the key data, the key data read request is cleared (DO is set high) and the LC75808W performs another key scan. Also note that DO, being an open-drain output, requires a pull-up resistor (between 1kΩ and 10kΩ).

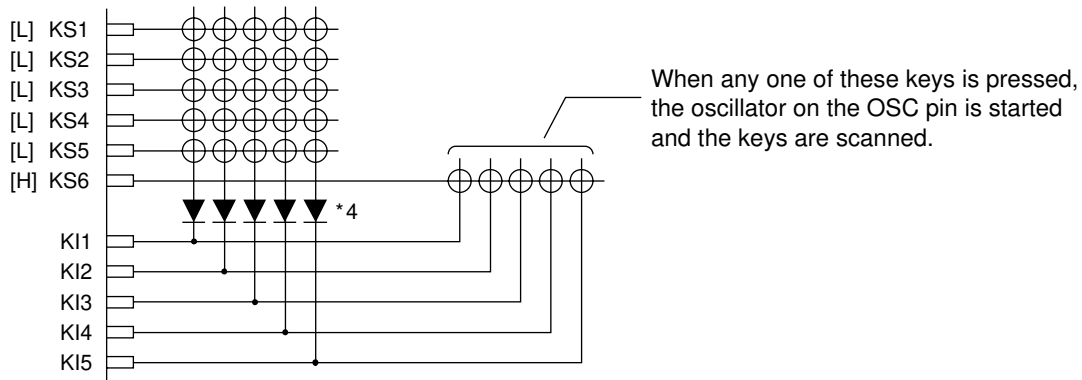

A12912

### 3. In sleep mode

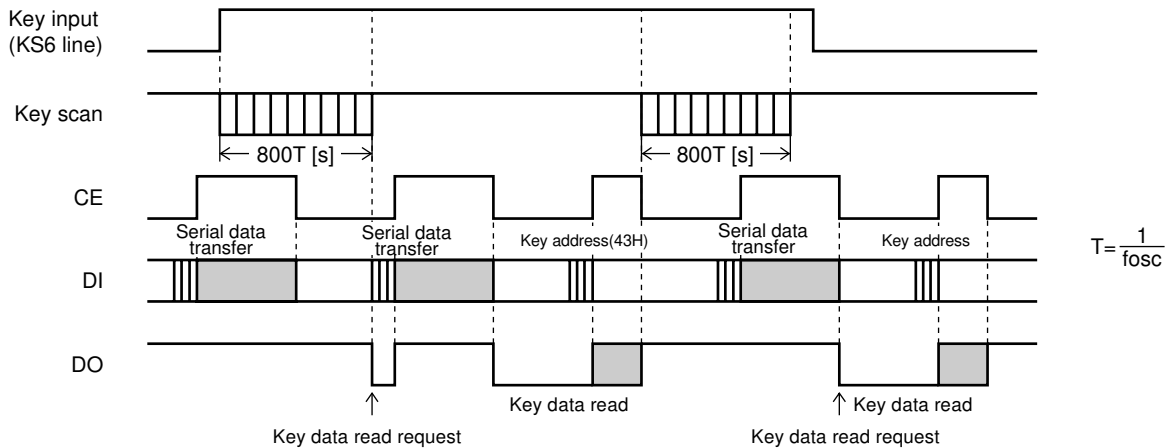

- The pins KS1 to KS6 are set to high or low by the KC1 to KC6 bits in the control data.
- If a key on one of the lines corresponding to a KS1 to KS6 pin which is set high is pressed, the oscillator on the OSC pin is started and a key scan is performed. Keys are scanned until all keys are released. Multiple key presses are recognized by determining whether multiple key data bits are set.
- If a key is pressed for longer than  $800T$  (where  $T = \frac{1}{f_{OSC}}$ ) the LC75808W outputs a key data read request (a low level on DO) to the controller. The controller acknowledges this request and reads the key data. However, if CE is high during a serial data transfer, DO will be set high.
- After the controller reads the key data, the key data read request is cleared (DO is set high) and the LC75808W performs another key scan. However, this does not clear sleep mode. Also note that DO, being an open-drain output, requires a pull-up resistor (between 1 kΩ and 10 kΩ).
- Sleep mode key scan example

Example: When the control data bits KC1 to KC5 are 0, KC6 is 1, and SP is 1. (sleep with only KS6 high)

A12913

Note: \*4. These diodes are required to reliably recognize multiple key presses on the KS6 line when sleep mode state with only KS6 high, as in the above example. That is, these diodes prevent incorrect operations due to sneak currents in the KS6 key scan output signal when keys on the KS1 to KS5 lines are pressed at the same time.

A12914

### Multiple Key Presses

Although the LC75808W is capable of key scanning without inserting diodes for dual key presses, triple key presses on the KI1 to KI5 input pin lines, or multiple key presses on the KS1 to KS6 output pin lines, multiple presses other than these cases may result in keys that were not pressed recognized as having been pressed. Therefore, a diode must be inserted in series with each key. Applications that do not recognize multiple key presses of three or more keys should check the key data for three or more 1 bits and ignore such data.

A12917

### Voltage Detection Type Reset Circuit (VDET)

This circuit generates an output signal and resets the system when logic block power is first applied and when the voltage drops, i.e., when the logic block power supply voltage is less than or equal to the power down detection voltage  $V_{DET}$ , which is 3.0V, typical. To assure that this function operates reliably, a capacitor must be added to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when the logic block power is first applied and the logic block power supply voltage  $V_{DD}$  fall time when the voltage drops are both at least 1 ms. (See Figure 3, 4, and 5.)

### Power Supply Sequence

The following sequences must be observed when power is turned on and off. (See Figure 3, 4, and 5.)

- Power on: Logic block power supply( $V_{DD}$ ) on → LCD driver block power supply( $V_{LCD}$ ) on
- Power off: LCD driver block power supply( $V_{LCD}$ ) off → Logic block power supply( $V_{DD}$ ) off

However, if the logic and LCD driver blocks use a shared power supply, then the power supplies can be turned on and off at the same time.

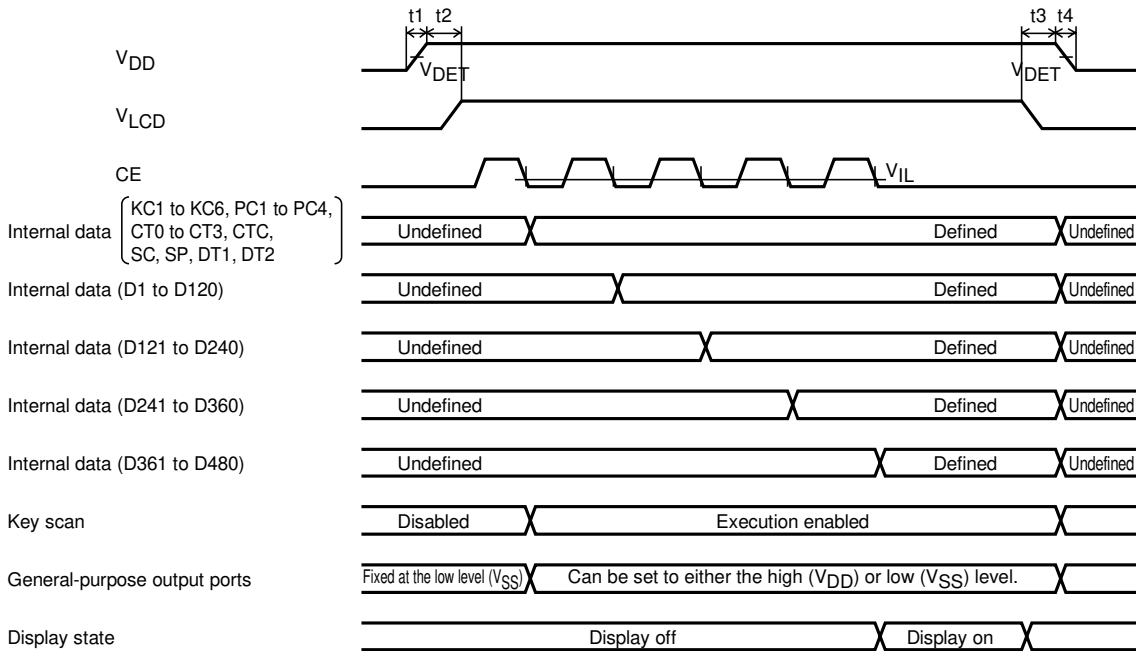

### System Reset

#### 1. Reset Function

The LC75808W performs a system reset with the  $V_{DET}$ . When a system reset is applied, the display is turned off, key scanning is disabled, the key data is reset, and the general-purpose output ports are set to and held at the low level ( $V_{SS}$ ). These states that are created as a result of the system reset can be cleared by executing the instruction described below. (See figure 3, 4, and 5.)

- Clearing the display off state  
Transferring all the serial data (the display data and the control data) creates a state in which the display is turned on.
- Clearing the key scan disabled and key data reset states  
Transferring the control data not only creates a state in which key scanning can be performed, but also clears the key data reset.
- Clearing the general-purpose output ports locked at the low level ( $V_{SS}$ ) state  
Transferring the control data clears the general-purpose output ports locked at the low level ( $V_{SS}$ ) state and sets the states of the general-purpose output ports.

#### • 1/8 duty

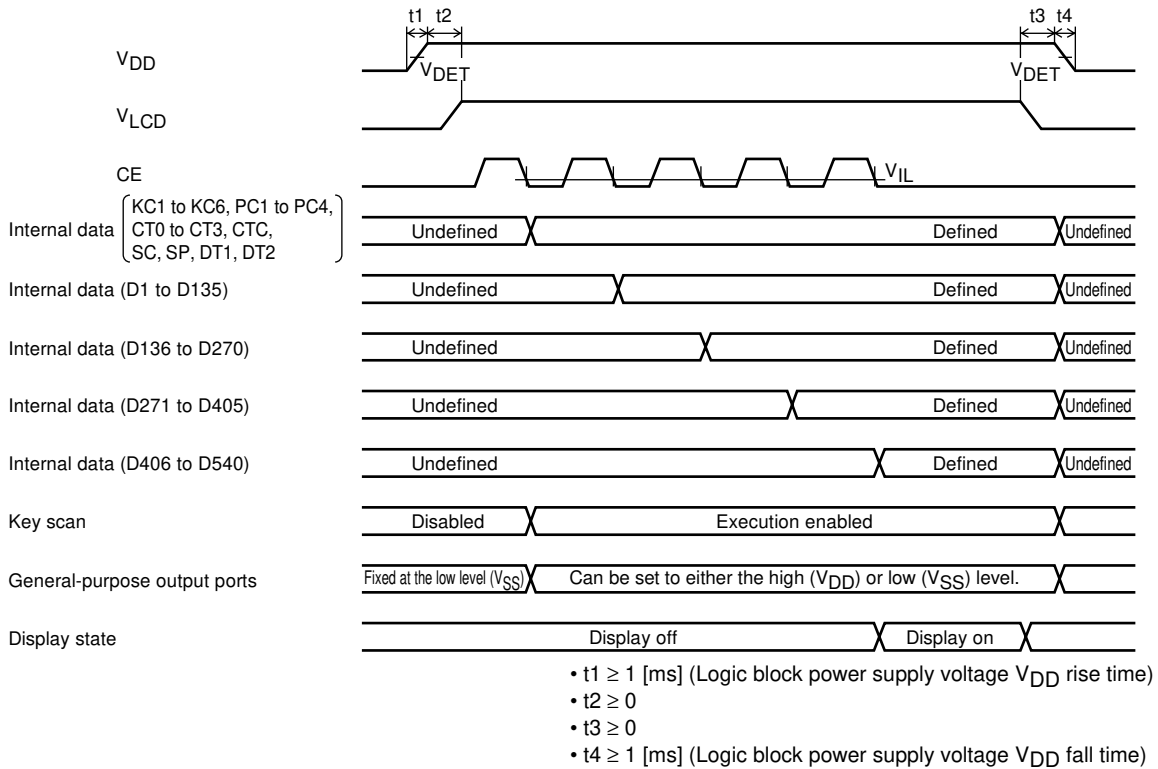

- $t1 \geq 1$  [ms] (Logic block power supply voltage  $V_{DD}$  rise time)
- $t2 \geq 0$
- $t3 \geq 0$
- $t4 \geq 1$  [ms] (Logic block power supply voltage  $V_{DD}$  fall time)

# LC75808W

## 2. LC75808W internal block states during the system reset

- **CLOCK GENERATOR**

Reset is applied and the base clock is stopped. However, the OSC pin state (normal or sleep mode) is determined after the SP control data bit is transferred.

- **COMMON DRIVER, SEGMENT DRIVER & LATCH**

Reset is applied and the display is turned off. However, display data can be input to the latch circuit in this state.

- **CONTRAST ADJUSTER**

Reset is applied and operation of the display contrast adjustment circuit is disabled. After that, once CT0 to CT3 and CTC in the control data have been transferred to the IC it will then be possible to set the display contrast.

- **KEY SCAN, KEY BUFFER**

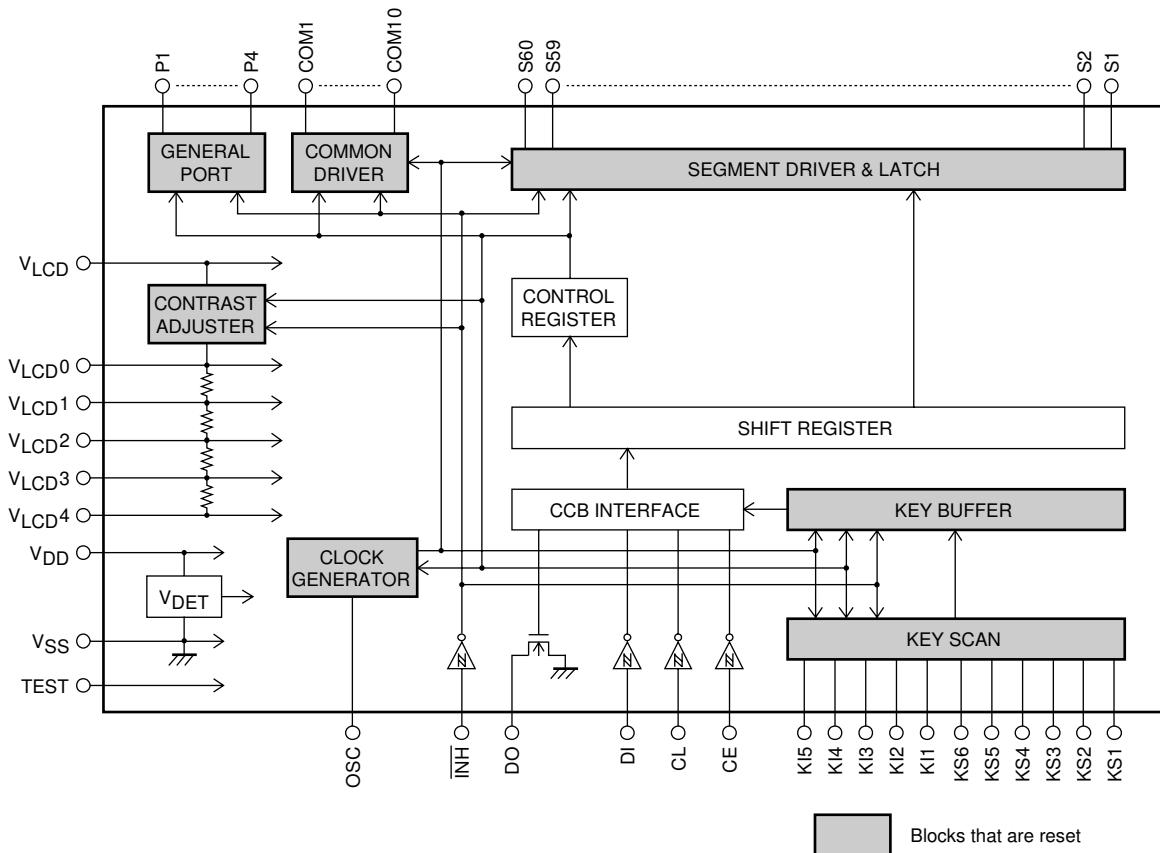

Reset is applied, these circuits are forcibly initialized internally, and key scan operation is disabled. Also, the key data is all set to 0. After that, once KC1 to KC6 in the control data have been transferred to the IC it will then be possible to perform key scan operations.

- **GENERAL PORT**

Reset is applied and the states of the general-purpose output ports are held fixed at the low level ( $V_{SS}$ ).

- **CCB INTERFACE, SHIFT REGISTER, CONTROL REGISTER**

Since serial data transfer is possible, these circuits are not reset.

A12921

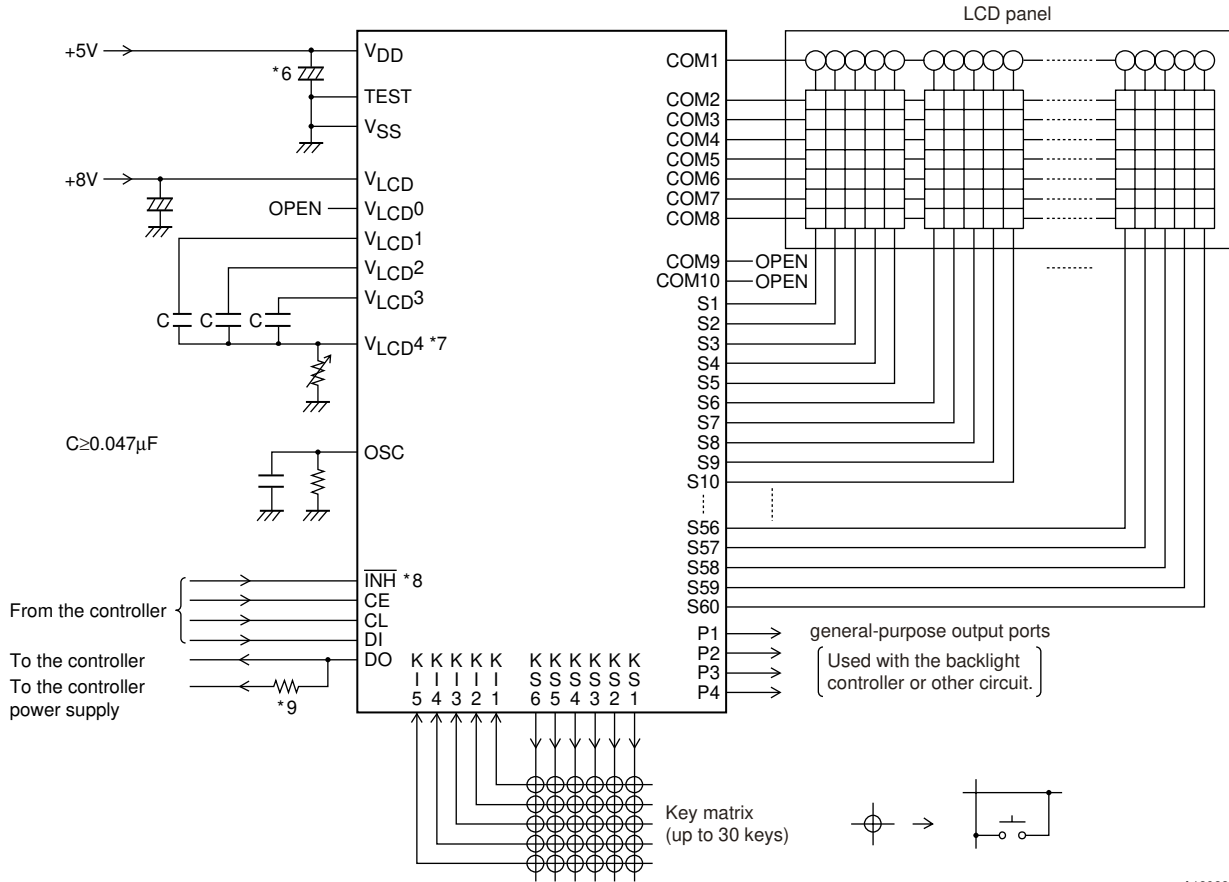

## 3. Output pin states during the system reset

Output pin	State during reset
S1 to S60	L( $V_{LCD4}$ )
COM1 to COM10	L( $V_{LCD4}$ )
KS1 to KS6	L( $V_{SS}$ )
P1 to P4	L( $V_{SS}$ )
DO	H *5

Note: \*5. Since this output pin is an open-drain output, a pull-up resistor of between 1k $\Omega$  and 10 k $\Omega$  is required. This pin is held at the high level even if a key data read operation is performed before the KC1 to KC6 control data has been transferred to the IC.

Sample Application Circuit 1

1/8 duty, 1/4 bias drive technique (for use with normal panels)

A12922

Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .

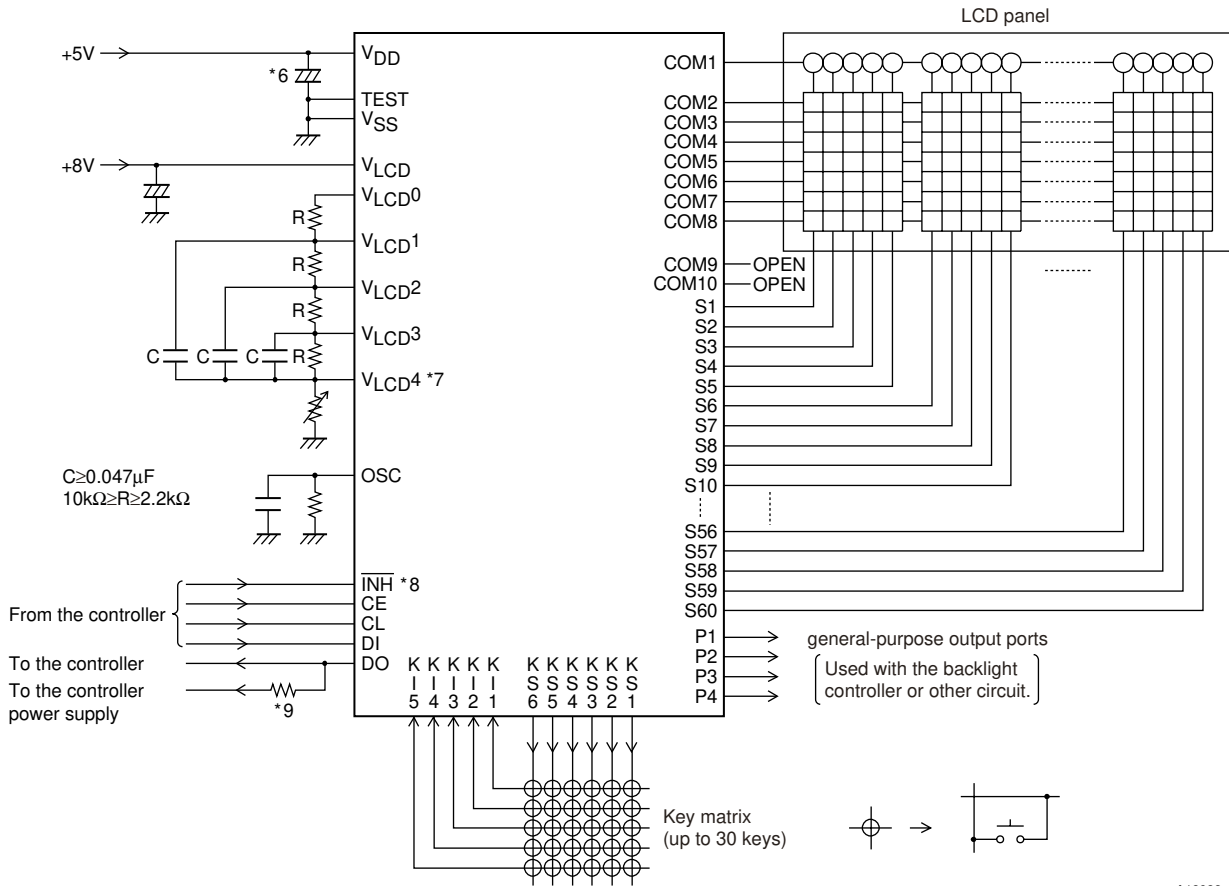

\*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.

\*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .

\*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1k $\Omega$  to 10k $\Omega$ ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

Sample Application Circuit 2

1/8 duty, 1/4 bias drive technique (for use with large panels)

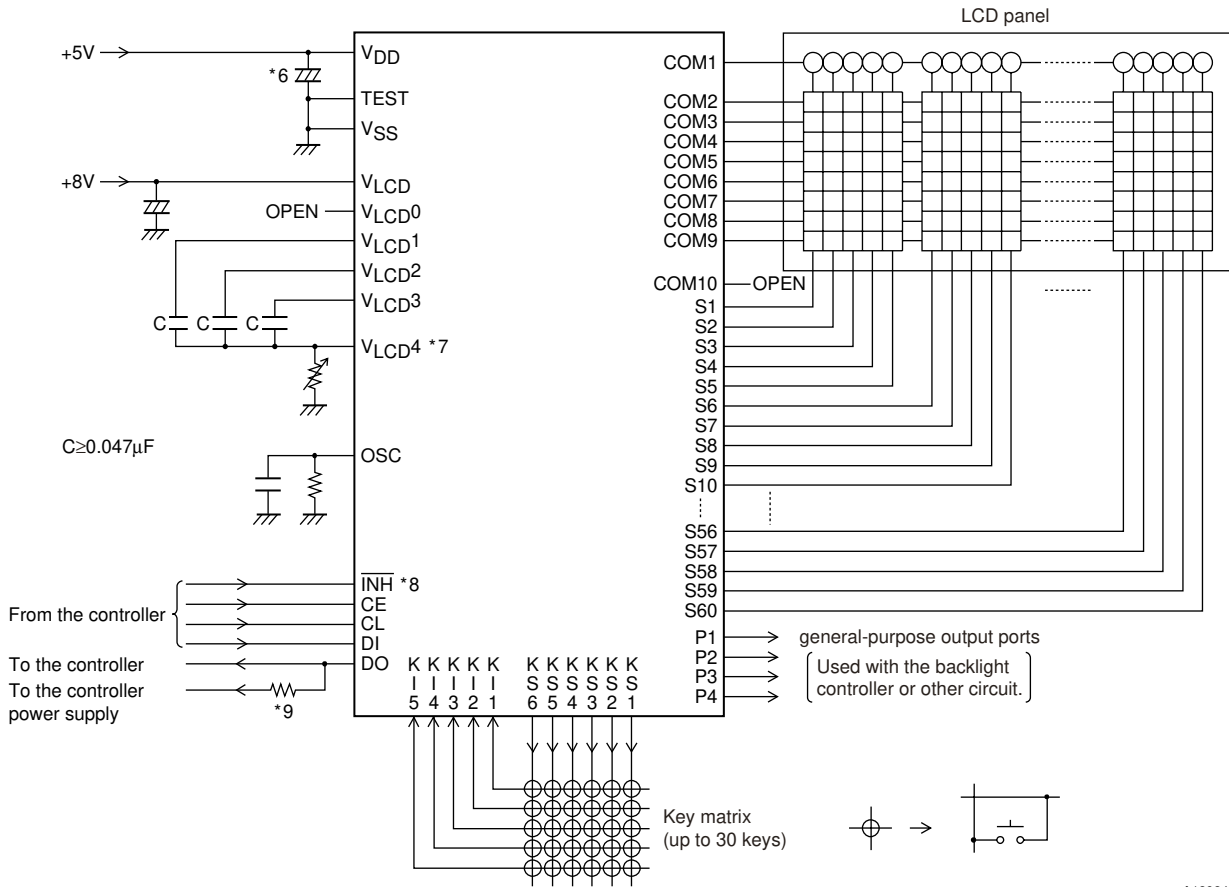

A12923

- Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .
- \*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.
- \*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .
- \*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1k $\Omega$  to 10k $\Omega$ ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

Sample Application Circuit 3

1/9 duty, 1/4 bias drive technique (for use with normal panels)

A12924

Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .

\*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.

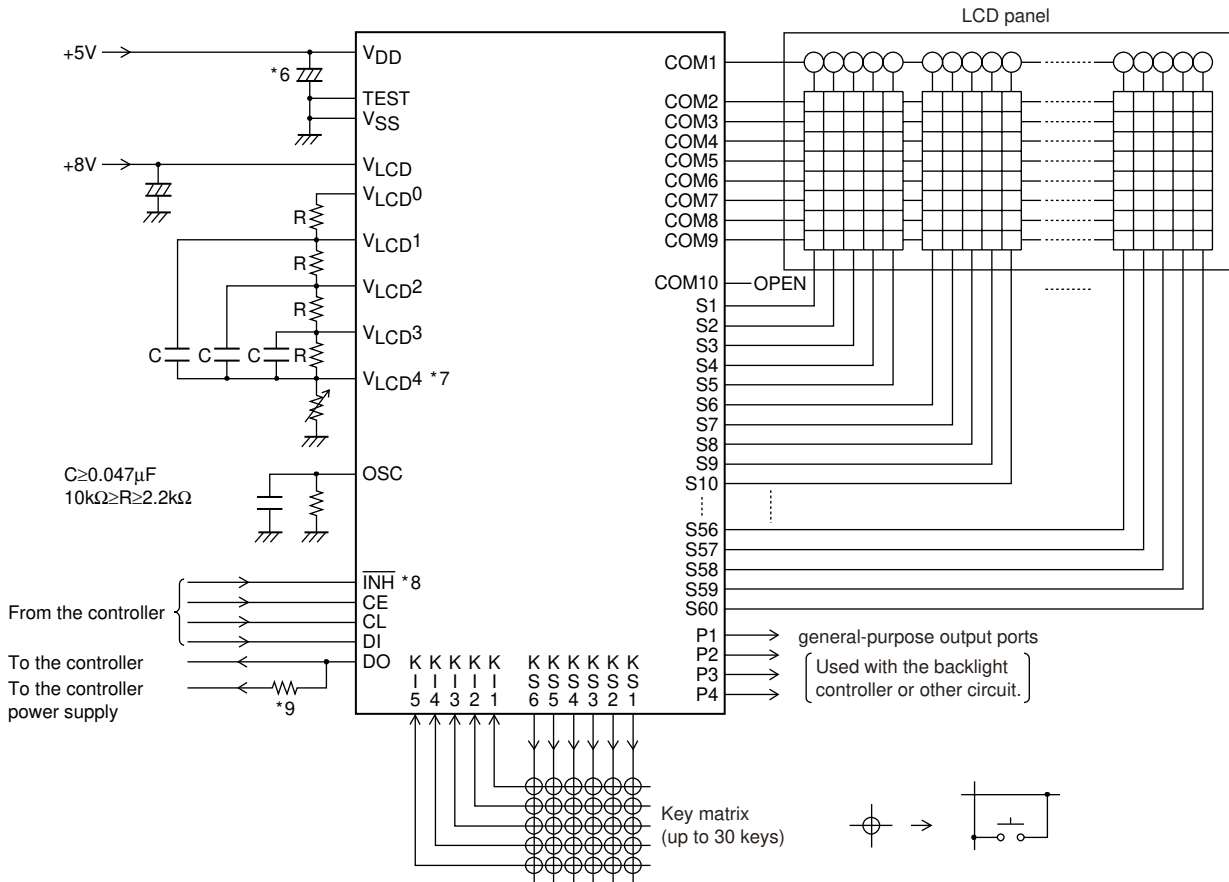

\*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .

\*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1k $\Omega$  to 10k $\Omega$ ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

Sample Application Circuit 4

1/9 duty, 1/4 bias drive technique (for use with large panels)

A12925

Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .

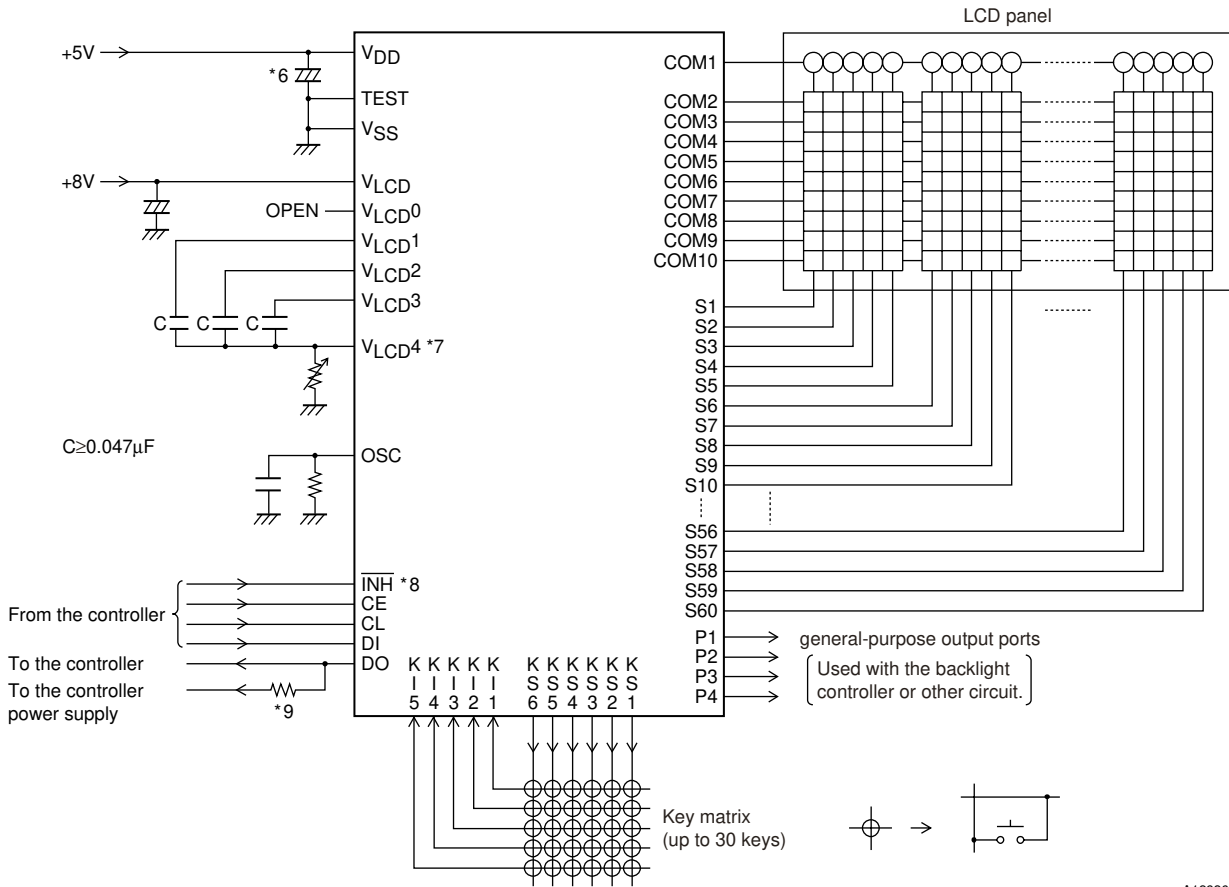

\*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.

\*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .

\*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1kΩ to 10kΩ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

Sample Application Circuit 5

1/10 duty, 1/4 bias drive technique (for use with normal panels)

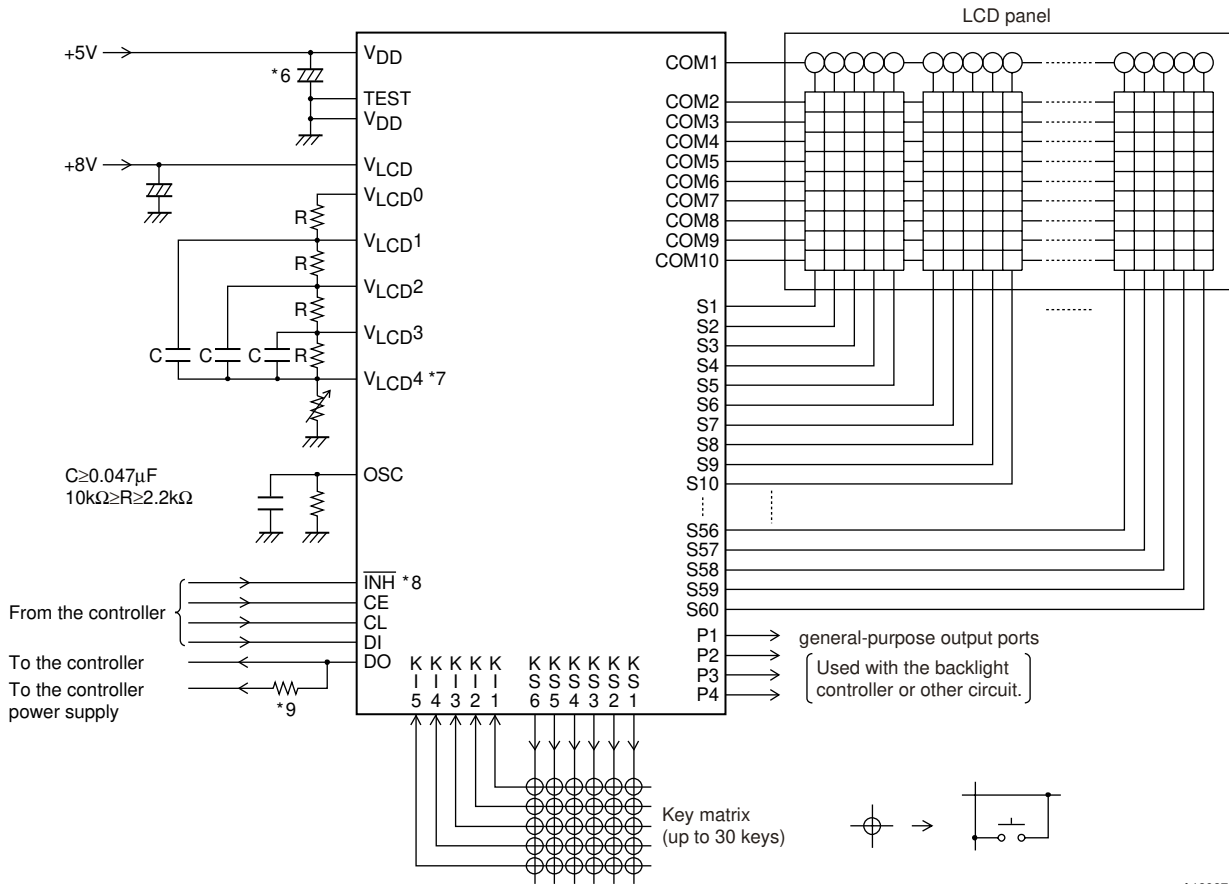

A12926

- Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .
- \*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.
- \*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .
- \*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1kΩ to 10kΩ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

Sample Application Circuit 6

1/10 duty, 1/4 bias drive technique (for use with large panels)

A12927

Note: \*6. Add a capacitor to the logic block power supply line so that the logic block power supply voltage  $V_{DD}$  rise time when power is applied and the logic block power supply voltage  $V_{DD}$  fall time when power drops are both at least 1ms, as the LC75808W is reset by the  $V_{DET}$ .

\*7. If a variable resistor is not used for display contrast fine adjustment, the  $V_{LCD4}$  pin must be connected to ground.

\*8. If the function of the  $\overline{INH}$  pin is not used, the  $\overline{INH}$  pin must be connected to the logic block power supply  $V_{DD}$ .

\*9. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1k $\Omega$  to 10k $\Omega$ ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

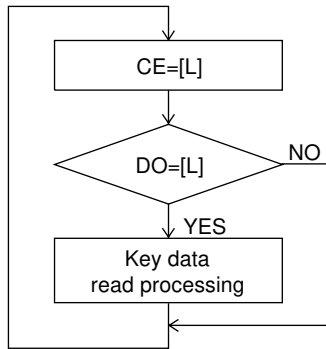

Notes on Transferring Display Data from the Controller

The display data is transferred to the LC75808W in four operations. All of the display data should be transferred within 30ms to maintain the quality of the displayed image.

Notes on the Controller Key Data Read Techniques

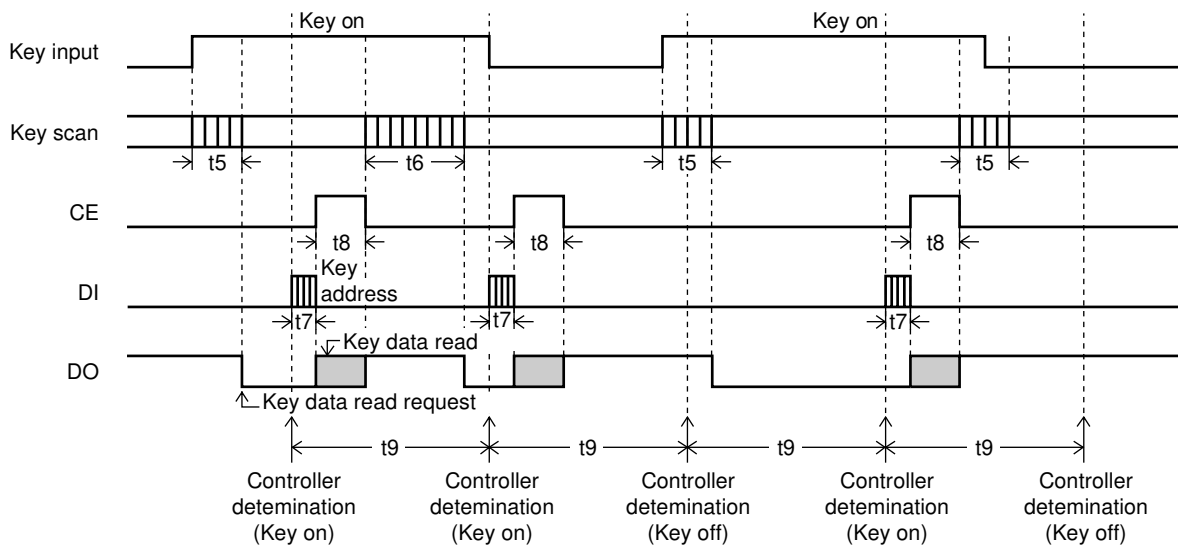

1. Timer based key data acquisition

• Flowchart

A12928

• Timing chart

A12929

t5: Key scan execution time when the key data agreed for two key scans. (800T(s))

t6: Key scan execution time when the key data did not agree for two key scans and the key scan was executed again. (1600T(s))

t7: Key address (43H) transfer time

t8: Key data read time

$$T = \frac{1}{f_{OSC}}$$

• Explanation

In this technique, the controller uses a timer to determine key on/off states and read the key data. The controller must check the DO state when CE is low every t9 period without fail. If DO is low, the controller recognizes that a key has been pressed and executes the key data read operation.

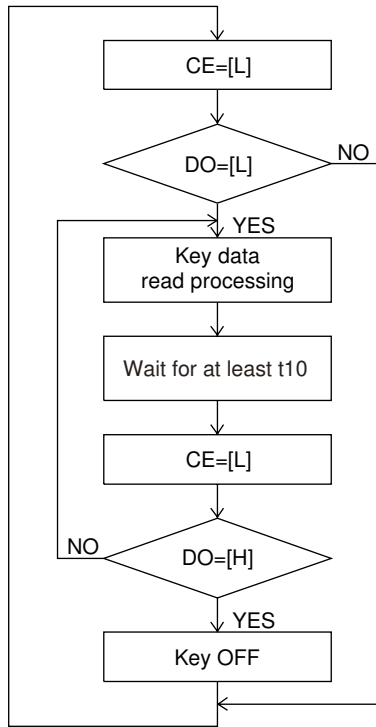

The period t9 in this technique must satisfy the following condition.

$$t9 > t6 + t7 + t8$$

If a key data read operation is executed when DO is high, the read key data (KD1 to KD30) and sleep acknowledge data (SA) will be invalid.

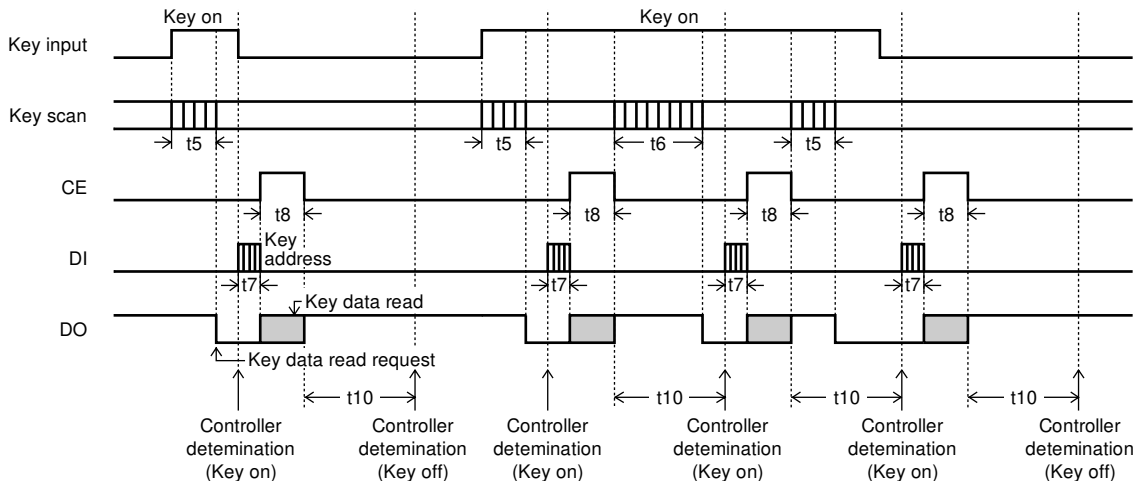

2. Interrupt based key data acquisition

• Flowchart

A12930

• Timing chart

A12931

t5: Key scan execution time when the key data agreed for two key scans. (800T(S))

t6: Key scan execution time when the key data did not agree for two key scans and the key scan was executed again. (1600T(S))

t7: Key address (43H) transfer time

t8: Key data read time

$$T = \frac{1}{f_{OSC}}$$

• Explanation

In this technique, the controller uses interrupts to determine key on/off states and read the key data. The controller must check the DO state when CE is low. If DO is low, the controller recognizes that a key has been pressed and executes the key data read operation. After that the next key on/off determination is performed after the time t10 has elapsed by checking the DO state when CE is low and reading the key data. The period t10 in this technique must satisfy the following condition.

$$t10 > t6$$

If a key data read operation is executed when DO is high, the read key data (KD1 to KD30) and sleep acknowledge data (SA) will be invalid.
