Quick Start

Recommended Equipment

- A DC power supply capable of supplying a voltage between 2.7V to 3.6V at 500mA
- CVBS and S-video signal generator
- Video measurement equipment (e.g., Tektronix VM700T or equivalent)

Procedure

The MAX9589 EV kit is fully assembled and tested. Follow the steps below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Connect the power supply to the pads labeled VDD and GND on the MAX9589 EV kit.
- 2) Connect the desired test signals from the video signal generator to the IN_A/CVBS, IN_B/CVBS, IN_C/LUMA(Y), and IN_D/CHROMA(C) BNC connectors.
- 3) Connect the output signals from the OUT_A, OUT_B, OUT_C, and OUT_D BNC connectors to the inputs of the video measurement equipment.
- 4) Turn on the power supply and verify the output signals.

MAX9589 Evaluation Kit

Detailed Description

The MAX9589 EV kit demonstrates the MAX9589 low-power, quad-channel video filter amplifier with integrated reconstruction filters. The EV kit operates from 2.7V to 3.6V with a 2V/V fixed gain.

The MAX9589 has $\pm 1\text{dB}$ (typ) passband flatness at 7MHz and 40dB attenuation at 27MHz and the outputs can be DC-coupled to a 75 Ω load, which is the equivalent of two video loads, or AC-coupled to a 150 Ω load.

AC-Coupling the Output

The output of the MAX9589 can be AC-coupled. To keep the highpass formed by the 150 Ω equivalent resistance of the video transmission line to a corner frequency of 4.8Hz or lower, remove the 0 Ω resistors on R9–R12 and install $\geq 220\mu\text{F}$ coupling capacitors on the C7–C10 pads.
