#### General Description

Applications

Maxim's redesigned DG417/DG418/DG419 precision, CMOS, monolithic analog switches now feature guaranteed on-resistance matching ( $3\Omega$  max) between switches and guaranteed on-resistance flatness over the signal range ( $4\Omega$  max). These switches conduct equally well in either direction and guarantee low charge injection, low power consumption, and an ESD tolerance of 2000V minimum per Method 3015.7. The new design offers low off-leakage current over temperature (less than 5nA at +85°C).

The DG417/DG418 are single-pole/single-throw (SPST) switches. The DG417 is normally closed, and the DG418 is normally open. The DG419 is single-pole/double-throw (SPDT) with one normally closed switch and one normally open switch. Switching times are less than 175ns max for t<sub>ON</sub> and less than 145ns max for t<sub>OFF</sub>. Operation is from a single +10V to +30V supply, or bipolar  $\pm 4.5$ V to  $\pm 20$ V supplies. The improved DG417/DG418/DG419 are fabricated with a 44V silicon-gate process.

Sample-and-Hold Circuits	Communications Systems
Test Equipment	Battery-Operated Systems
Modems	Fax Machines
Guidance and Control System	ns PBX, PABX
Audio Signal Routing	Military Radios

#### \_New Features

- Plug-In Upgrades for Industry-Standard DG417/DG418/DG419
- Improved RDS(ON) Match Between Channels (3Ω max, DG419 only)
- Guaranteed RFLAT(ON) Over Signal Range (4Ω max)
- Improved Charge Injection (10pC max)
- Improved Off-Leakage Current Over Temperature (<5nA at +85°C)</li>
- Withstand Electrostatic Discharge (2000V min) per Method 3015.7

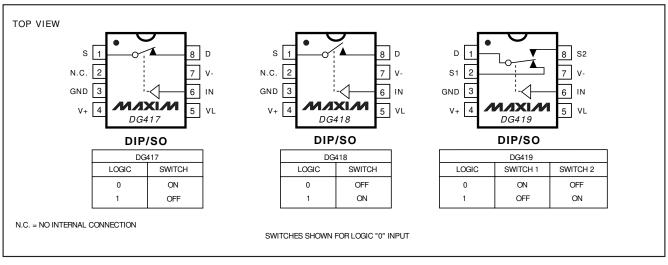

#### \_\_Existing Features

- Low RDS(ON) (35Ω max)
- Single-Supply Operation +10V to +30V Bipolar-Supply Operation ±4.5V to ±20V
- Low Power Consumption (35µW max)
- Rail-to-Rail Signal Handling
- TTL/CMOS-Logic Compatible

#### **ABSOLUTE MAXIMUM RATINGS**

Voltage Referenced to V-

V+	
GND	25V
VL	(GND - 0.3V) to (V+ + 0.3V)
Digital Inputs VS, VD (Note 1)	(V 2V) to (V+ + 2V) or 30mA
	(whichever occurs first)
Continuous Current (any termina	I) (Note 1)

Peak Current, S or D (pulsed at 1ms, 10% duty cycle max)..100mA

Continuous Power Dissipation ( $I_A = +70^{\circ}C$ )	
Plastic DIP (derate 9.09mW/°C above +70	)°C)727mW
SO (derate 5.88mW/°C above +70°C)	471mW
CERDIP (derate 8.00mW/°C above +70°C	;)640mW
Operating Temperature Ranges	
DG41_C	0°C to +70°C
DG41_D	40°C to +85°C
DG41_AK	55°C to +125°C
Storage Temperature Range	65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

Note 1: Signals on S, D, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### **ELECTRICAL CHARACTERISTICS**—Dual Supplies

Note 2: Typical values are for design aid only, are not guaranteed, and are not subject to production testing. The algebraic convention where the most negative value is a minimum and the most positive value a maximum is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: On-resistance match between channels and flatness is guaranteed only with bipolar-supply operation. Flatness is defined as the difference between the maximum and the minimum value of on-resistance as measured at the extremes of the specified analog range.

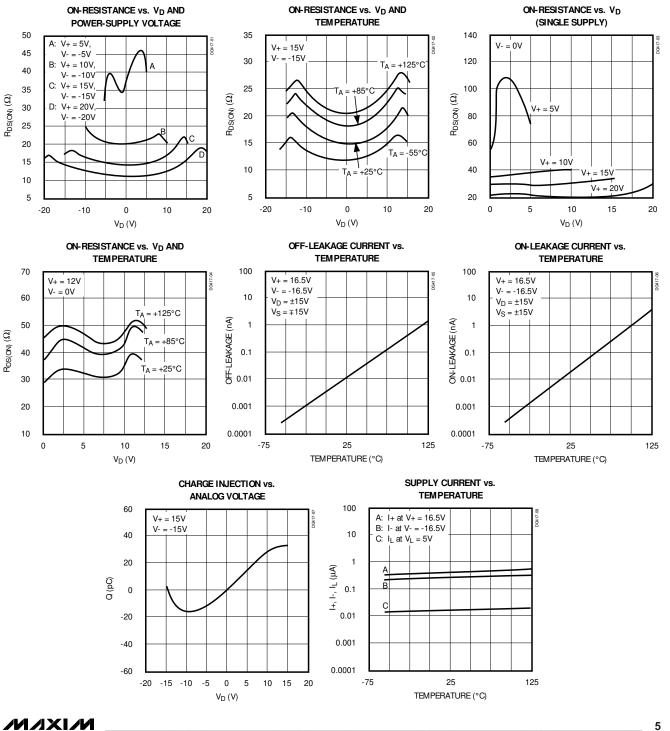

Note 5: Leakage parameters I<sub>S(OFF)</sub>, I<sub>D(OFF)</sub>, and I<sub>D(ON)</sub> are 100% tested at the maximum rated hot temperature and guaranteed by correlation at +25°C.

Note 6: Off-Isolation Rejection Ratio = 20log ( $V_D/V_S$ ),  $V_D$  = output,  $V_S$  = input to off switch.

**Note 7:** Between any two switches.

#### Applications Information

#### **Operation with Supply Voltages** Other than ±15V

Using supply voltages other than ±15V reduces the analog signal range. The DG417/DG418/DG419 switches operate with ±4.5V to ±20V bipolar supplies or with a +10V to +30V single supply; connect V- to 0V when operating with a single supply. Also, all device types can operate with unbalanced supplies, such as +24V and -5V. VL must be connected to +5V to be TTL compatible, or to V+ for CMOS-logic level inputs. The Typical Operating Characteristics graphs show typical on-resistance with ±20V, ±15V, ±10V, and ±5V supplies. (Switching times increase by a factor of two or more for operation at  $\pm 5V$ .)

#### **Overvoltage Protection**

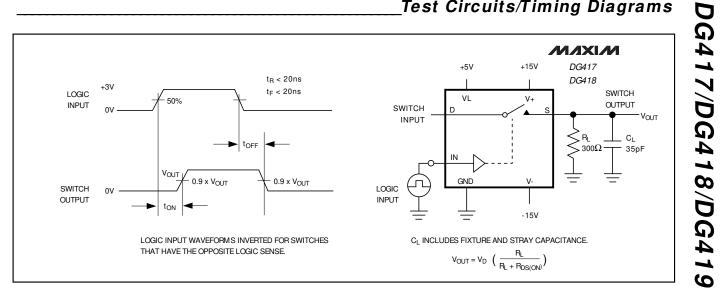

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence V+ on first, followed by VL, V-, and logic inputs. If power-supply sequencing is not possible, add two small, external signal diodes in series with the supply pins for overvoltage protection (Figure 1).

**Pin Description** 

Figure 1. Overvoltage Protection Using External Blocking Diodes

Adding diodes reduces the analog signal range to 1V below V+ and 1V above V-, without affecting low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed +44V.
