General Description

The 8308I is a low-skew, 1-to-8 Fanout Buffer. The 8308I has two selectable clock inputs. The CLK, nCLK pair can accept most differential input levels. The LVCMOS_CLK can accept LVCMOS or LVTTL input levels. The low impedance LVCMOS/LVTTL outputs are designed to drive 50Ω series or parallel terminated transmission lines. The effective fanout can be increased from 8 to 16 by utilizing the ability of the outputs to drive two series terminated transmission lines.

The 8308I is characterized for 3.3V core/3.3V output, 3.3V core/2.5V output or 2.5V core/2.5V output operation. Guaranteed output and part-part skew characteristics make the 8308I ideal for those clock distribution applications requiring well defined performance and repeatability.

Features

- Eight LVCMOS/LVTTL outputs, (7Ω typical output impedance)
- Selectable LVCMOS_CLK or differential CLK, nCLK inputs
- CLK, nCLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Maximum Output Frequency: 350MHz
- Output Skew: (3.3V± 5%): 100ps (maximum)
- Part to Part Skew: (3.3V± 5%): 1ns (maximum)
- Supply Voltage Modes:
  (Core/Output)
  3.3V/3.3V
  3.3V/2.5V
  2.5V/2.5V
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 11, 13, 15, 17, 19, 21, 23	Q0, Q1, Q7, Q6, Q5, Q4,Q3, Q2	Output		Clock outputs. LVCMOS / LVTTL interface levels.
2, 10, 14, 18, 22	GND	Power		Power supply ground.
3	CLK_SEL	Input	Pullup	Clock select input. Selects LVCMOS clock input when HIGH. Selects CLK, nCLK inputs when LOW. See Table 3A. LVCMOS / LVTTL interface levels.
4	LVCMOS_CLK	Input	Pullup	Clock input. LVCMOS / LVTTL interface levels.
5	CLK	Input	Pullup	Non-inverting differential clock input.
6	nCLK	Input	Pulldown	Inverting differential clock input.
7	CLK_EN	Input	Pullup	Clock enable. LVCMOS / LVTTL interface levels.
8	OE	Input	Pullup	Output enable. LVCMOS / LVTTL interface levels. See Table 3B.
9	V_{DD}	Power		Power supply pin.
12, 16, 20, 24	V_{DDO}	Power		Output supply pins.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Absolute Maximum Ratings

Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to V_{DD} + 0.5 V
Outputs, V_O	-0.5V to V_{DDO} + 0.5V
Package Thermal Impedance, θ_{JA}	70°C/W (0 lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

APPLICATION INFORMATION

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how a differential input can be wired to accept single ended levels. The reference voltage V_{REF} = V_{DD}/2 is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is 2.5V and V_{DD} = 3.3V, R1 and R2 value should be adjusted to set V_{REF} at 1.25V. The values below are for when both the single-ended swing and V_{DD} are at the same voltage. This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission line impedance. For most 50 applications, R3 and R4 can be 100Ω. The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V_{IL} cannot be less than -0.3V and V_{IH} cannot be more than V_{DD} + 0.3V. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

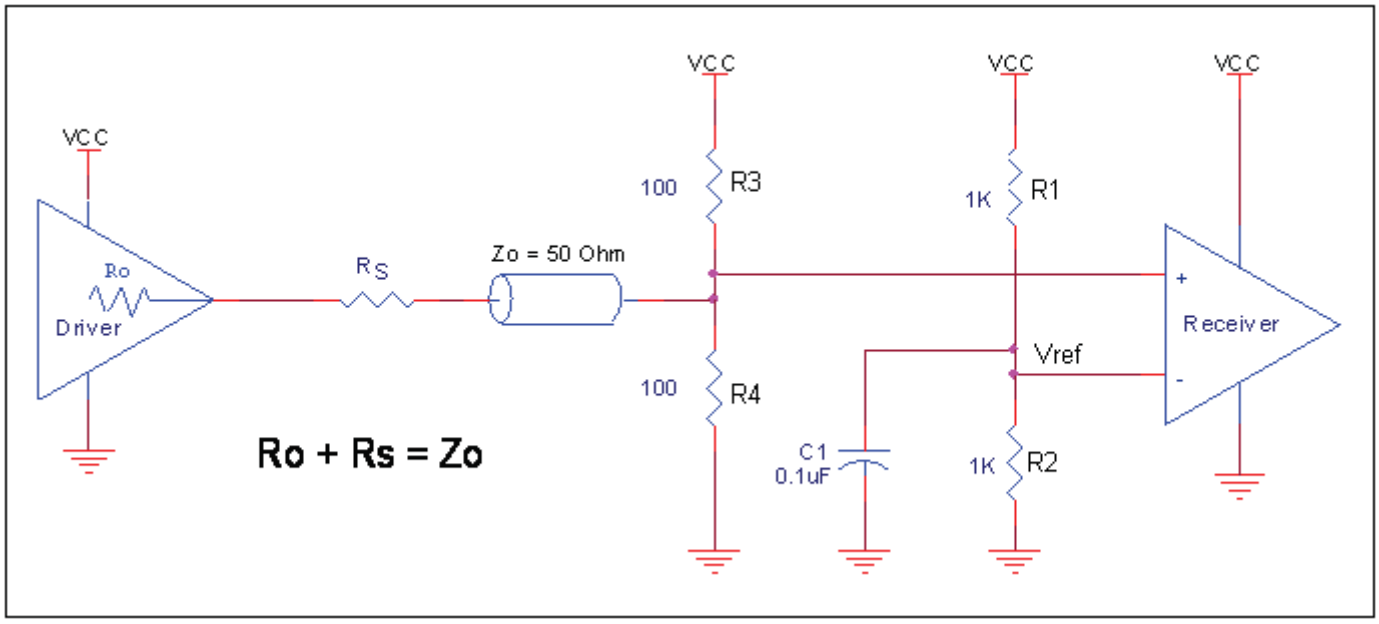

FIGURE 1. RECOMMENDED SCHEMATIC FOR WIRING A DIFFERENTIAL INPUT TO ACCEPT SINGLE-ENDED LEVELS

Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both differential signals must meet the V_{PP} and V_{CMR} input requirements. Figures 2A to 2E show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 2A,* the input termination applies for IDT LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

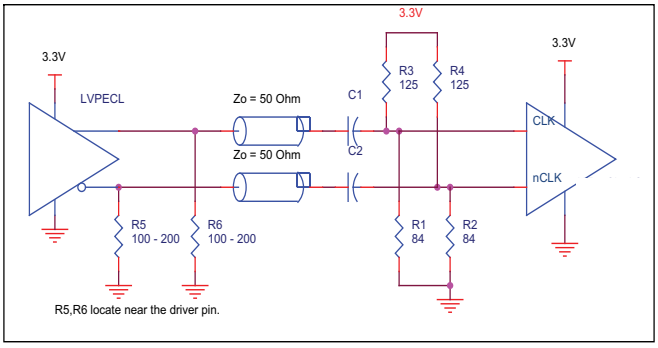

Figure 2E. CLK/nCLK Input Driven by 3.3V LVPECL Driver with AC Couple

Schematic Example

Figure 3 shows a schematic example of the 8308I. In this example, the LVCMOS_CLK input is selected. The decoupling capacitors should be physically located near the power pin.

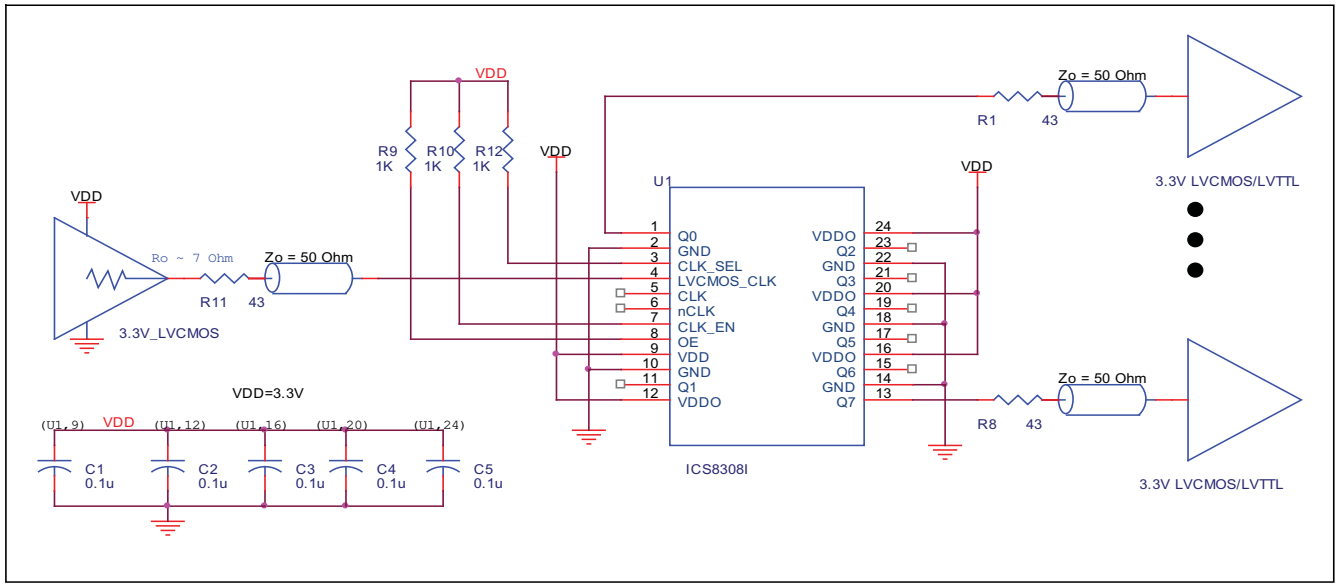

Figure 3. 8308I LVPECL Buffer Schematic Example

Recommendations for Unused Input and Output Pins

Inputs:

LVCMOS_CLK Input

For applications not requiring the use of an LVCMOS_CLK, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the LVCMOS_CLK input to ground.

CLK/nCLK Inputs

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from CLK to ground.

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs:

LVCMOS Outputs

All unused LVCMOS outputs can be left floating. There should be no trace attached.

Power On Sequence

There is no power on sequence requirement for the V_{DD} and V_{DDO}. If the V_{DDO} is turned on before the V_{DD}, there will be unknown state at the outputs during initial condition when the V_{DDO} is on and V_{DD} is off.

Reliability Information
