1.2 Features

- 3.0 V to 32 V operating supply voltage
- Operation from unregulated power supply
- Reverse polarity protection (-18 V)
- Overvoltage capability up to 42 V without external resistor
- Output overcurrent and overtemperature protection
- Active error compensation
- High stability of magnetic thresholds
- Low jitter (typ. 0.35 μ s)
- High ESD performance
- Small SMD package PG-SOT23-3-15

Product description**1.3 Target applications**

Target applications for the TLE496x Hall Switch family are all applications which require a high precision Hall Switch with an operating temperature range from -40°C to 170°C. Its superior supply voltage range from 3.0 V to 32 V with overvoltage capability (e.g. load-dump) up to 42 V without external resistor makes it ideally suited for automotive and industrial applications.

The TLE4964-3M is a unipolar switch with a typical operating point $B_{OP} = 12.5$ mT and a hysteresis of $B_{HYS} = 3.0$ mT. It is ideally suited for various position detection applications.

1.4 Product validation

Qualified for automotive applications. Product validation according to AEC-Q100.

Functional description

2 Functional description

2.1 General

The TLE4964-3M is an integrated Hall effect switch designed specifically for highly accurate applications with superior supply voltage capability, operating temperature range and temperature stability of the magnetic thresholds.

Functional description

2.5 Functional block description

The chopped Hall IC switch comprises a Hall probe, bias generator, compensation circuits, oscillator and output transistor.

The bias generator provides currents for the Hall probe and the active circuits. Compensation circuits stabilize the temperature behavior and reduce influence of technology variations.

The active error compensation (chopping technique) rejects offsets in the signal path and the influence of mechanical stress to the Hall probe caused by molding and soldering processes and other thermal stress in the package. The chopped measurement principle together with the threshold generator and the comparator ensures highly accurate and temperature stable magnetic thresholds.

The output transistor has an integrated overcurrent and overtemperature protection.

Functional description

2.6 Default start-up behavior

The magnetic thresholds exhibit a hysteresis $B_{HYS} = B_{OP} - B_{RP}$. In case of a power-on with a magnetic field B within hysteresis ($B_{OP} > B > B_{RP}$) the output of the sensor is set to the pull up voltage level (V_Q) per default. After the first crossing of B_{OP} or B_{RP} of the magnetic field the internal decision logic is set to the corresponding magnetic input value.

V_{DDA} is the internal supply voltage which is following the external supply voltage V_{DD} .

This means for $B > B_{OP}$ the output is switching, for $B < B_{RP}$ and $B_{OP} > B > B_{RP}$ the output stays at V_Q .

Figure 6 Start-up behavior of the TLE4964-3M

Specification

3 Specification

3.1 Application circuit

The following **Figure 7** shows the basic option of an application circuit. Only a pull-up resistor R_Q is necessary. An external series resistor for V_S is not needed. The resistor R_Q has to be in a dimension to match the applied V_S to keep I_Q limited to the operating range of maximum 25 mA.

e.g.: $V_S = 12\text{ V}$ and $R_Q = 1200\ \Omega$ gives $I_Q = 12\text{ V}/1200\ \Omega = 10\text{ mA}$

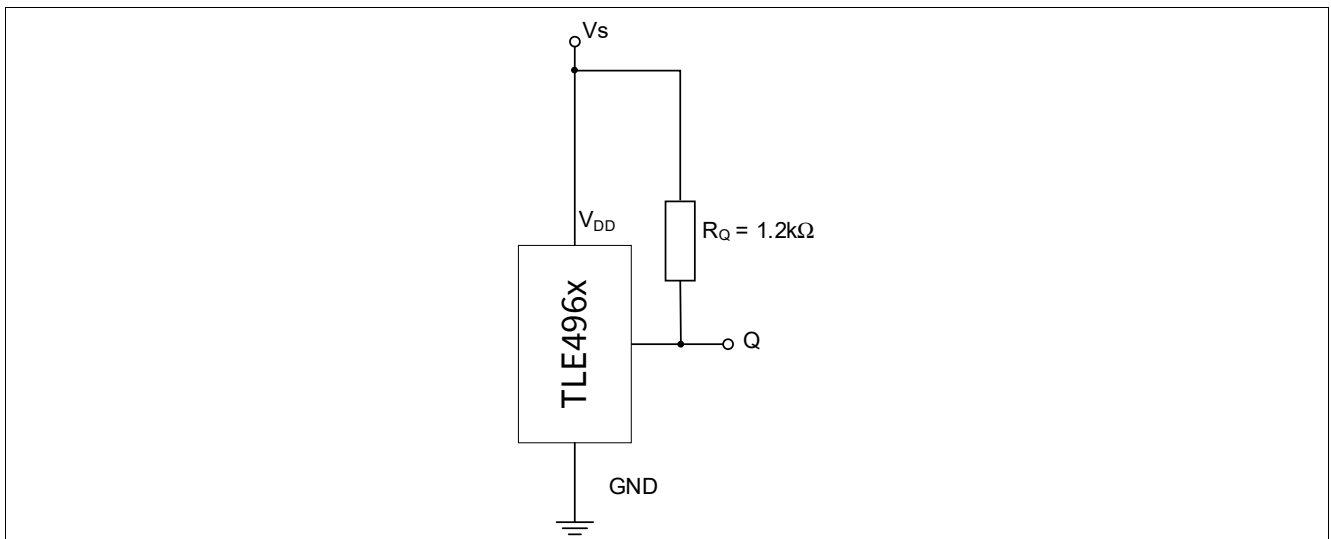

Figure 7 Basic application circuit #1: only pull-up resistor is necessary

Figure 8 Enhanced application circuit #2: for extended ESD robustness

With an additional capacitor C_{DD} and a transient voltage suppression (TVS) diode an extended ESD robustness of 15 kV on system level is achieved (**Figure 8**). If an increased robustness for e.g. testpulse 1 is required, a serial resistor in the supply needs to be added (see also **Chapter 3.5**).

Thermal resistance Junction ambient	R_{thJA}	–	–	300	K/W	for PG-SOT23-3-15 (2s2p)
Thermal resistance Junction lead	R_{thJL}	–	–	100	K/W	for PG-SOT23-3-15

1) This lifetime statement is an anticipation based on an extrapolation of Infineon's qualification test results. The actual lifetime of a component depends on its form of application and type of use etc. and may deviate from such statement. The lifetime statement shall in no event extend the agreed warranty period.

Attention: *Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.*

Calculation of the dissipated power P_{DIS} and junction temperature T_J of the chip (SOT23 example):

e.g. for: $V_{DD} = 12\text{ V}$, $I_S = 2.5\text{ mA}$, $V_{QSAT} = 0.5\text{ V}$, $I_Q = 20\text{ mA}$

Power dissipation: $P_{DIS} = 12\text{ V} \times 2.5\text{ mA} + 0.5\text{ V} \times 20\text{ mA} = 30\text{ mW} + 10\text{ mW} = 40\text{ mW}$

Temperature $\Delta T = R_{thJA} \times P_{DIS} = 300\text{ K/W} \times 40\text{ mW} = 12\text{ K}$

For $T_A = 150^\circ\text{C}$: $T_J = T_A + \Delta T = 150^\circ\text{C} + 12\text{ K} = 162^\circ\text{C}$

Specification

ESD voltage (CDM) ³⁾	V_{ESD}	-1	-	1	kV	-
ESD voltage (system level) ⁴⁾	V_{ESD}	-15	-	15	kV	with circuit shown in and Figure 8

1) Characterization of ESD is carried out on a sample basis, not subject to production test.

2) Human Body Model (HBM) tests according to ANSI/ESDA/JEDEC JS-001.

3) Charge device model (CDM) tests according to JESD22-C101.

4) Gun test (2 k Ω / 330 pF or 330 Ω / 150 pF) according to ISO 10605-2008.

3.3 Operating range

The following operating conditions must not be exceeded in order to ensure correct operation of the TLE4964-3M.

All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

The maximum tested magnetic field is 600 mT.

Table 5 Operating conditions parameters

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply voltage	V_{DD}	3.0	-	32 ¹⁾	V	-
Output voltage	V_{Q}	-0.3	-	32	V	-
Junction temperature	T_{J}	-40	-	170	$^\circ\text{C}$	-
Output current	I_{Q}	0	-	25	mA	-
Magnetic signal input frequency ²⁾	f_{SW}	0	-	10	kHz	-

1) Latch-up test with factor 1.5 is not covered. Please see max ratings also.

2) For operation at the maximum switching frequency the magnetic input signal must be 1.4 times higher than for static fields. This is due to the -3 dB corner frequency of the internal low-pass filter in the signal path.

Specification

3.4 Electrical and magnetic characteristics

Product characteristics involve the spread of values guaranteed within the specified voltage and ambient temperature range. Typical characteristics are the median of the production and correspond to $V_{DD} = 12\text{ V}$ and $T_A = 25^\circ\text{C}$. The below listed specification is valid in combination with the application circuit shown in [Figure 7](#) and [Figure 8](#).

Table 6 General electrical characteristics

Chopper frequency ¹⁾	f_{OSC}	–	350		kHz	–

1) Not subject to production test, verified by design/characterization.

2) Output jitter is the 1 σ value of the output switching distribution.

3) Systematic delay between magnetic threshold reached and output switching.

4) Time from applying $V_{DD} = 3.0\text{ V}$ to the sensor until the output is valid.

- 1) The magnetic noise is normal distributed and can be assumed as nearly independent to frequency without sampling noise or digital noise effects. The typical value represents the rms-value and corresponds therefore to a 1 σ probability of normal distribution. Consequently a 3 σ value corresponds to 0.3% probability of appearance.
- 2) Not subject to production test, verified by design/characterization.

Field direction definition

Positive magnetic fields are defined with the south pole of the magnet to the branded side of package.
