

TS3310/12/14 Data Sheet

True 150 nA I_Q , Selectable 1.8 to 5 V_{OUT} Instant-On Boost Converter

The TS3310/12/14 is a low power boost switching regulator with an industry leading low quiescent current of 150 nA(typ). The 150 nA is the actual current consumed from the battery while the output is in regulation. The TS3310's extremely low power internal circuitry consumes 120 nA on average, with periodic switching cycles which service the load occurring at intervals of up to 25 seconds, together yielding the average 150 nA. The TS3310/12/14 steps up input voltages from 0.9 V (TS3312: 2 V) to 5 V to sixteen selectable output voltages ranging from 1.8 V to 5 V. The TS3310/12/14 includes two output options, one being an always-on storage output while the additional output is an output load switch that is designed to supply burst-on loads in a low duty cycle manner. The TS3310/12/14 operates in Discontinuous Conduction Mode with an on-time proportional to $1/V_{IN}$, thereby limiting the maximum input current by the selection of the inductor value, ensuring the input current does not drag down the input source.

The extremely low quiescent current combined with the output load switch make the TS3310/12/14 an ideal choice for applications where the load can be periodically powered from the output, while being disconnected from the output storage capacitor when the load is powered off to isolate the load's leakage current.

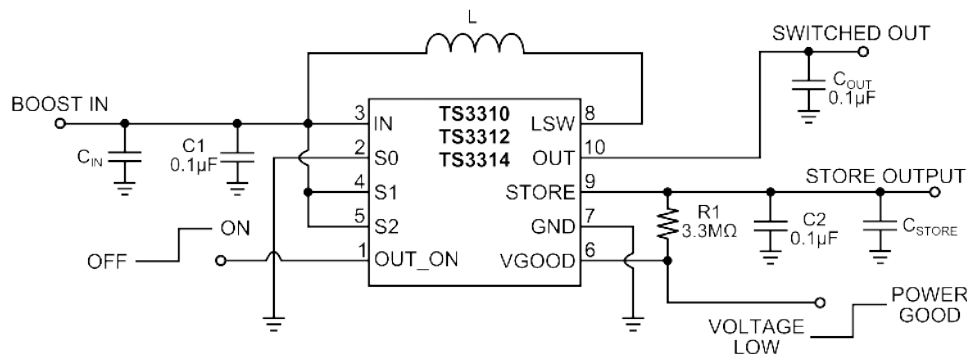

The TS3310/12/14 is fully specified over the $-40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$ temperature range and is available in a low-profile, thermally-enhanced 10-pin 2x2 mm TDFN package with an exposed back-side paddle.

Applications

- Coin-Cell-Powered Portable Equipment
- Single-Cell Lithium-Ion or Alkaline Battery-Powered Equipment
- Solar or Mechanical Energy Harvesting
- Wireless Microphones
- Wireless Remote Sensors
- RFID Tags
- Personal Health-Monitoring Devices
- ZigBee Radio Enabled Devices
- Low-Energy Bluetooth Radio Enabled Devices

KEY FEATURES

- Market-Leading, Active-Mode, No-load Supply Current: $I_Q = 150\text{ nA}$
- Efficiency up to 92%
- Input Voltage Range: 0.9 to 5.0 V
- Delivers up to 35 mA at V_{STORE} from 1.2 V_{IN}
- Single Inductor, Discontinuous Conduction Mode Operation
- User-Enabled Secondary Output Load Switch to Isolate Leaky Burst Loads
- No External Schottky Diode Required
- UVLO Threshold
 - 0.9 V (TS3310/14)
 - 2.0 V (TS3312)
- Pin-Selectable Output Voltages:
 - 1.8 V, 2.1 V, 2.5 V, 2.85 V, 3 V, 3.3 V, 4.1 V, 5 V (TS3310)
 - 2.1 V, 2.5 V, 2.85 V, 3 V, 3.3 V, 4.1 V, 5 V (TS3312)
 - 4 V, 4.2 V, 4.35 V, 4.5 V, 4.6 V, 4.7 V, 4.8 V, 4.9 V (TS3314)
- 10-pin, 2 mm × 2 mm TDFN Package

1. Ordering Information

| Ordering Part Number | Description | Output Voltage Options (V) |
|----------------------|---------------------------------|---------------------------------------|
| TS3310ITD1022 | Boost regulator with 0.9 V UVLO | 1.8, 2.1, 2.5, 2.85, 3, 3.3, 4.1, 5 |
| TS3312ITD1022 | Boost Regulator with 2 V UVLO | 2.1, 2.5, 2.85, 3, 3.3, 4.1, 5 |
| TS3314ITD1022 | Boost Regulator with 0.9 V UVLO | 4, 4.2, 4.35, 4.5, 4.6, 4.7, 4.8, 4.9 |

Note:

1. Adding the suffix "T" to the part number (e.g., TS3310ITD1022T) denotes tape and reel.

2. System Overview

2.1 Typical Application Circuit

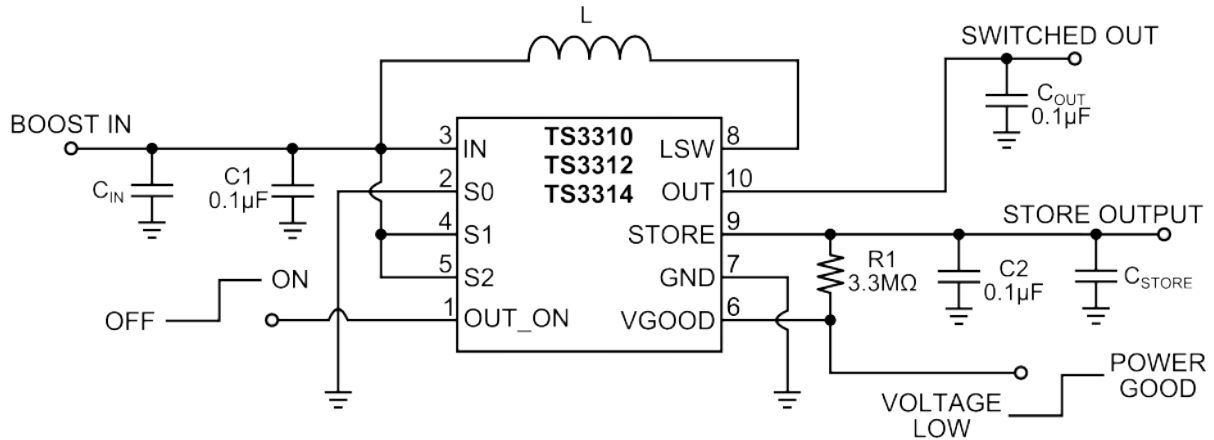

Table 2.1. Typical Application Circuit A and Circuit B Values

| | Circuit A | Circuit B |
|----------------------|----------------------------|-----------------------------|
| L | 10 µH PN: CBC3225T100KR | 100 µH PN: CBC3225T101KR |
| $C_{IN} = C_{STORE}$ | 22 µF | 2.2 µF |

2.2 Functional Block Diagram

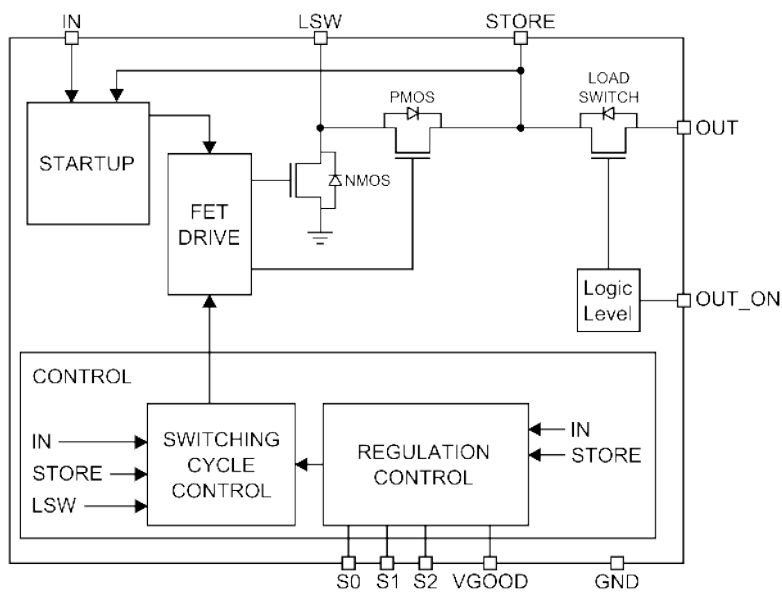

Figure 2.1. TS331x Functional Block Diagram

2.2.1 Theory of Operation

The TS3310/12/14 is a boost switching regulator with an industry leading low quiescent current of 150 nA. The 150 nA is the actual current consumed from the battery while the output is in regulation. The TS3310/12/14's extremely low power internal circuitry consumes 120 nA on average, with periodic switching cycles which service the load occurring at intervals of up to 25 seconds, as displayed in the scope captures titled "Input Quiescent Current : Circuit A with No-Load" in [3.1 Typical Performance Characteristics](#). The always-on output voltage at STORE is regulated by a comparator within the Regulation Control block. When a load discharges C_{STORE} and causes the output voltage to drop below the desired regulated voltage, switching periods are initiated. When the output voltage is at or above the desired regulated voltage, the comparator causes switching periods to stop.

Each switching cycle includes an ON period and an OFF period. During the ON period, the NMOS switch turns on to ramp current in the inductor, while during the OFF period, the NMOS switch turns off and the PMOS switch turns on to discharge inductor current into the C_{STORE} capacitor. When the ON and OFF cycles have completed, the PMOS switch turns off. The TS3310/12/14 operates in Discontinuous Conduction Mode (DCM); during any given switching cycle, the inductor current starts at and returns to zero. The switching cycle timing is governed by the Control block, which determines the ON and OFF periods according to the input and output voltages, regardless of the inductor current. The Control block sets the ON period according to the following equation:

$$t_{ON} = \frac{2.2 \mu s}{V_{IN}}$$

Equation 1. ON Period Calculation

Then, the choice of inductor value determines the peak switching currents:

$$I_{pk} = \frac{V_{IN} \times t_{ON}}{L} = \frac{2.2 \mu s}{L}$$

Equation 2. Peak Current Calculation

The average input current, $I_{IN(AVG)}$, will vary according to the load, since as the load is increased, the time between switching cycles is decreased. However, $I_{IN(AVG)}$ will never exceed $I_{IN(AVG,MAX)}$, the maximum averaged input current, which represents the case where switching periods are continuously initiated.

$$I_{IN(AVG,MAX)} = \frac{I_{pk}}{2} = \frac{1.1 \mu s}{L}$$

Equation 3. Maximum Average Input Current Calculation

The above equation shows that an input current limit can be set by choice of inductor value, set appropriately for the capacity and output impedance of the input source.

Maximum available output current is also a function of inductor value for the case where switching cycles are continuously initiated, the expected maximum STORE output current is:

$$I_{STORE(MAX)} = \frac{V_{IN}}{V_{OUT}} \times I_{IN(AVG,MAX)} \times \text{Efficiency}$$

Equation 4. Expected Maximum STORE Current Calculation

2.2.2 Output Voltage Options

The Regulation Controls within the Control block monitor and control the regulation of the STORE output voltage. By strapping a combination of logic input pins (S0–S2) high or low, the STORE output voltage can be one of the selectable output voltages.

Table 2.2. STORE Output Value Options

| S2 | S2 | S0 | TS3310 STORE | TS3312 STORE | TS3314 STORE |
|----|----|----|--------------|--------------|--------------|
| 0 | 0 | 0 | 1.8 V | — | 4 V |
| 0 | 0 | 1 | 2.5 V | 2.5 V | 4.2 V |
| 0 | 1 | 0 | 3.3 V | 3.3 V | 4.35 V |
| 0 | 1 | 1 | 5 V | 5 V | 4.5 V |
| 1 | 0 | 0 | 2.1 V | 2.1 V | 4.6 V |
| 1 | 0 | 1 | 2.85 V | 2.85 V | 4.7 V |
| 1 | 1 | 0 | 3 V | 3 V | 4.8 V |
| 1 | 1 | 1 | 4.1 V | 4.1 V | 4.9 V |

The TS3310/12/14 provides an additional Instant-On switched OUT output that completely isolates loads from the storage capacitor at the STORE output. The OUT load switch is controlled by the logic input pin OUT_ON.

2.2.3 Output Load at Startup, VGOOD Output, and UVLO Feature

The TS3310/12/14 provides an Open-Drain VGOOD output that assumes a high impedance once the STORE output is greater than 90% of the target voltage.

At startup, the TS3310/12/14 can provide 5% of the maximum STORE output load current. Once the Open-Drain VGOOD output has assumed a high impedance, the TS3310/12/14 can be loaded with the expected maximum STORE current. The startup time varies depending on the input voltage, output voltage selection, inductor, and input/output capacitor configuration.

The TS3310 and TS3314 come with an Under Voltage Lockout (UVLO) feature at 0.9 V, while the TS3312 comes with a UVLO feature at 2 V. TS3310 and TS3314 UVLO features have a 20 mV hysteresis. The TS3312 UVLO feature has a 100 mV hysteresis. The UVLO feature monitors the input voltage and inhibits the Switching Cycle Controls from initiating switching cycles if the VIN is too low. This ensures no switching currents are drawn from the input to collapse the voltage at the terminals of the battery when the internal resistance of the battery is high. The following figure displays the UVLO feature for the TS3310.

Figure 2.2. TS3310, UVLO = 0.9 V

2.2.4 Inductor Selection

When selecting an inductor value, the value should be chosen based on output current requirements. If the input source is a small battery, make sure the choice of the inductor value considers the maximum input current that the source battery can support (based on series resistance). For example, some small button cell batteries can exhibit 5Ω series resistance, therefore a 20 mA maximum input current may be appropriate (100 mV drop). Consider using a large STORE capacitor to support peak loads for small batteries (see [2.2.6 Bursted Load with Big STORE Buffer Capacitor](#)).

Figure 2.3. Expected Maximum STORE Output Current with 85% Efficiency vs. Inductor Value

Figure 2.4. $I_{IN(AVG,MAX)}$ vs. Inductor Value

A low ESR, shielded inductor is recommended. Depending upon the application, the inductor value will vary. For applications with load currents less than a few milliamperes, a 100 μH inductor is recommended. As shown by the efficiency curves in [3.1 Typical Performance Characteristics](#), the efficiency is greater with a larger inductor value for smaller load currents. Please refer to the "Maximum STORE Output Current vs. Input Voltage" graphs found in [3.1 Typical Performance Characteristics](#). Circuit A, which uses a 10 μH inductor, is able to source larger load currents than that of Circuit B with a 100 μH inductor due to the larger peak currents.

Figure 2.5. Inductor Peak Current vs. Inductor Value

The chosen inductor's saturation current for a specific inductor value should be at least 50% greater than the peak inductor current value displayed in the above figure. The following table provides a list of inductor manufacturers.

Table 2.3. Inductor Manufacturers

| Inductors | |
|-------------|--|
| Coilcraft | www.coilcraft.com |
| Taiyo Yuden | www.t-yuden.com |
| Murata | www.murata.com |
| Sumida | www.sumida.com |

The following tables show some example inductors for values of 10 µH and 100 µH that may be used for Circuit A or B. The tables include the inductors' Rdc (inductor series dc resistance or ESR) saturation current and dimensions. As mentioned previously, the inductor's saturation current should always be greater than 150% of the peak inductor current; therefore, the appropriate size and efficiency (dependent upon ESR) may be chosen based on application requirements.

Table 2.4. Taiyo-Yuden Example Inductors

| Inductor Value P/N | Inductor Type | Rdc (Ω) | Saturation Current (mA) | (LxWxH) (mm) |
|------------------------|---------------|---------|-------------------------|-----------------|
| 10 µH CBC20166T100K | CBC 2016 | 0.82 | 380 | 2 x 1.6 x 1.6 |
| 10 µH CBC2518T100K | CBC 2518 | 0.36 | 480 | 2.5 x 1.8 x 1.8 |

2.2.5 Input and STORE Capacitor Selection

Ceramic capacitors are recommended for C_{IN} and C_{STORE} , due to ceramics' extremely low leakage currents (generally limited by very high insulation resistance). Larger value ceramics (10 μF or greater) may use high constant dielectric materials, such as X5R and X7R. These materials exhibit a strong voltage coefficient and substantially lower capacitance than rated when operated near the maximum specified voltage. For these types of capacitors, use a 10 V or greater voltage rating.

The STORE voltage output ripple can be reduced by increasing the value of C_{STORE} . The figure below displays the STORE output voltage ripple for two different storage capacitor values. The output voltage ripple reaches a floor value when the internal voltage comparator hysteresis becomes the dominant source of ripple. Below this level, larger capacitance does not help reduce the ripple.

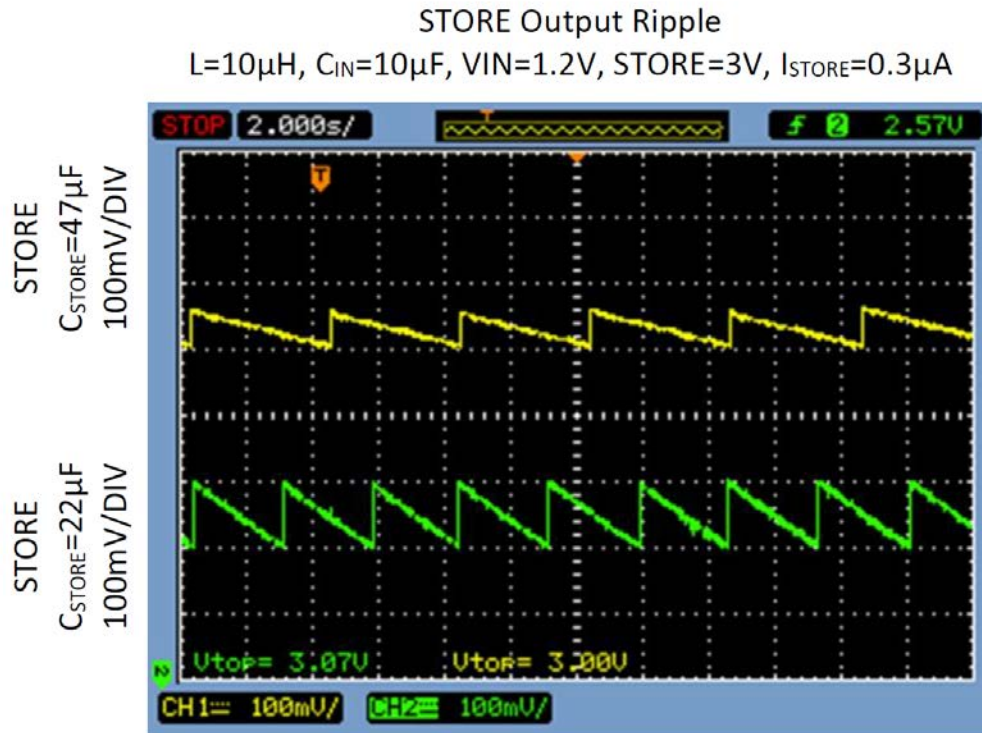

Figure 2.6. Output Voltage Ripple Comparison

2.2.6 Bursted Load with Big STORE Buffer Capacitor

The TS3310 provides a switched OUT output that is capable of sourcing short bursts of large output current by utilizing a large storage capacitor at the STORE output. The figure below displays an application circuit that utilizes this functionality.

The circuit is powered from a LR44 1.5 V Coin Cell Battery. In this example, the load needs to be powered on once every 20 seconds for 200 μ s periods. The load requires a 3.3 V source and demands 100 mA current when it is powered on. Also in this example, the load continues to consume 10 μ A of leakage current when off. By attaching the load to OUT when the load isn't used, the TS3310 isolates the 10 μ A current so that overall quiescent current can be maintained. A 220 μ F storage capacitor is used for C_{STORE} so that it can store the necessary charge to supply the 100 mA load current. The microcontroller brings the Instant-On Load Switch, OUT_ON, high when the load needs to be powered on. The TS3310 on average consumes 160 nA between load bursts.

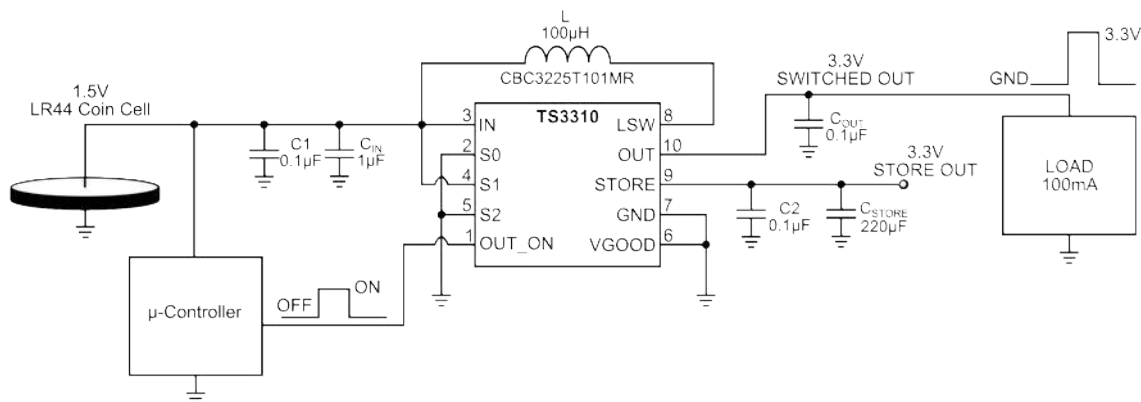

Figure 2.7. Bursted Load Application Circuit

To prevent the circuit from overloading the LR44 Coin Cell Battery, a 100 μ H inductor is used to ensure the TS3310 only draws 10 mA of current on average while recharging C_{STORE} after the load is powered off. After the load has been powered off, the TS3310 recharges the 220 μ F C_{STORE} capacitor within 6 ms and is ready for the next bursted cycle. The following figure displays the load being powered on for a 200 μ s period and the recharge of the 220 μ F C_{STORE} within 6 ms.

Bursted-Load w/ Big Store Buffer Capacitor

$L=100\mu\text{H}$, $C_{OUT}=0.1\mu\text{F}$, $C_{STORE}=220\mu\text{F}$

$V_{IN}=1.2\text{V}$, $STORE=3.3\text{V}$, $I_{OUT}=100\text{mA}$

OUT_ON Switched ON : Circuit A with C_{OUT} Removed
 V_{IN}=1.2V, STORE=3V, I_{STORE}=0.3μA, I_{OUT}=3mA

OUT_ON Switched OFF : Circuit A with C_{OUT} Removed
 V_{IN}=1.2V, STORE=3V, I_{STORE}=0.3μA, I_{OUT}=3mA

Short STORE to GND for 1msec Recovery : Circuit A
 V_{IN}=1.2V, STORE=3V, I_{STORE}=2mA

4. Pin Descriptions

Table 4.1. Pin Descriptions

| Pin | Name | Function |
|------|--------|--|
| 1 | OUT_ON | Logic Input. Turns on OUT switch. |
| 2 | IN | Boost Input. Connect to input source. |
| 3 | S0 | Logic Input. Sets the regulated voltage at STORE. |
| 4 | S1 | Logic Input. Sets the regulated voltage at STORE. |
| 5 | S2 | Logic Input. Sets the regulated voltage at STORE. |
| 6 | VGOOD | Open Drain Output. High impedance when STORE > 90% of regulation voltage. |
| 7 | GND | Ground. Connect this pin to the analog ground plane. |
| 8 | LSW | Inductor Connection. |
| 9 | STORE | Regulated output voltage set by S0, S1, S2 logic. Connect Storage capacitor. |
| 10 | OUT | Switched Output. |
| EPAD | EPAD | Exposed Paddle. Connect this pin to the analog ground plane. |

5. Packaging

5.1 TS3310/12/14 Package Dimensions

Figure 5.1. TS3310/12/14 2x2 mm 10-QFN Package Diagram

Table 5.1. Package Dimensions

| Dimension | Min | Nom | Max |
|-----------|-----------|-------|-------|
| A | 0.700 | 0.750 | 0.800 |
| A1 | 0.000 | --- | 0.050 |
| b | 0.150 | 0.200 | 0.250 |
| A3 | 0.203 REF | | |
| D | 2.000 BSC | | |
| e | 0.400 BSC | | |
| E | 2.000 BSC | | |
| D2 | 0.850 | 0.900 | 0.950 |
| E2 | 1.350 | 1.400 | 1.450 |
| L | 0.250 | 0.300 | 0.350 |
| aaa | 0.500 | | |
| bbb | 0.100 | | |
| ccc | 0.050 | | |
| ddd | 0.050 | | |
| eee | 0.080 | | |
| fff | 0.050 | | |

Note:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

5.2 TS3310 Top Marking

TS3310 Top Marking

Table 5.2. TS3310 Top Marking Explanation

| | | |
|----------------------------|--------------------------------------|--|
| Mark Method: | Laser | |
| Pin 1 Mark: | 0.35 mm Diameter (Lower-Left Corner) | |
| Font Size: | 0.40 mm (16 mils) | |
| Line 1 Mark Format: | Device Identifier | 3310 |
| Line 2 Mark Format: | TTTT = Mfg Code | Manufacturing Code from the Assembly Purchase Order Form |

6. Revision History

Revision 1.0

February 24, 2016

- Initial external release.

| | |
|--|-----------|
| 1. Ordering Information | 1 |
| 2. System Overview | 2 |
| 2.1 Typical Application Circuit | 2 |
| 2.2 Functional Block Diagram | 2 |
| 2.2.1 Theory of Operation | 3 |
| 2.2.2 Output Voltage Options | 4 |
| 2.2.3 Output Load at Startup, VGOOD Output, and UVLO Feature | 5 |
| 2.2.4 Inductor Selection | 6 |
| 2.2.5 Input and STORE Capacitor Selection | 9 |
| 2.2.6 Bursted Load with Big STORE Buffer Capacitor | 10 |
| 3. Electrical Characteristics | 11 |
| 3.1 Typical Performance Characteristics | 13 |
| 4. Pin Descriptions | 18 |
| 5. Packaging | 19 |
| 5.1 TS3310/12/14 Package Dimensions | 19 |
| 5.2 TS3310 Top Marking | 20 |
| 6. Revision History | 21 |

Smart.
Connected.

Disclaimer

Silicon Laboratories intends to provide customers with the latest, accurate, and in-depth documentation of all peripherals and modules available for system and software implementers using or intending to use the Silicon Laboratories products. Characterization data, available modules and peripherals, memory sizes and memory addresses refer to each specific device, and "Typical" parameters provided can and do vary in different applications. Application examples described herein are for illustrative purposes only. Silicon Laboratories reserves the right to make changes without further notice and limitation to product information, specifications, and descriptions herein, and does not give warranties as to the accuracy or completeness of the included information. Silicon Laboratories shall have no liability for the consequences of use of the information supplied herein. This document does not imply or express copyright licenses granted hereunder to design or fabricate any integrated circuits. The products are not designed or authorized to be used within any Life Support System without the specific written consent of Silicon Laboratories. A "Life Support System" is any product or system intended to support or sustain life and/or health, which, if it fails, can be reasonably expected to result in significant personal injury or death. Silicon Laboratories products are not designed or authorized for military applications. Silicon Laboratories products shall under no circumstances be used in weapons of mass destruction including (but not limited to) nuclear, biological or chemical weapons, or missiles capable of delivering such weapons.
