S6BP203A

ASSP, 42V, 2.4A, Synchronous Buck-boost DC/DC Converter IC

S6BP203A is a 1-Ch Buck-boost DC/DC converter IC with four built-in switching FETs. This IC is able to supply up to 2.4A of load current within the very wide range from 2.5V to 42V in the input voltage. This IC has an operation mode that is automatically changed to PFM operation during low load, which can achieve super-high efficiency with a very low quiescent current 50 µA. It is possible to provide stable output voltage from an automotive cold cranking and load dump, up to 42V, conditions within 1 ms transition time. As a result, this IC is suitable for power supply solutions of automotive and Industrial applications. This IC has the SYNC function, which is capable of selecting the SYNC_IN that is able to inputs an external clock signal. When an external clock signal in the range from 200 kHz to 400 kHz is inputted, the FETs perform the switching operation with synchronizing signal from an external clock. When an external clock signal is not inputted, the FETs perform the switching operation from an internal clock. The internal clock signal in the range from 200 kHz to 2.1 MHz can be set by an external resistor. Since external voltage setting resistors and phase compensation capacitors are not required with this IC, it can reduce the number of parts and a part mounting area. This IC has five protection functions, input under voltage lockout (input UVLO), output under voltage protection (output UVP), output over voltage protection (output OVP), output over current protection (output OCP), and thermal shutdown (TSD). Moreover, this IC has the power good (PG) function that indicates the state of the output voltage (VOUT pin). When the output voltage reaches the PG voltage, the PG signal is outputted.

Features

- Wide input voltage range: 2.5V to 42V
- Output voltage: 3.3V
- Wide operating frequency range: 200 kHz to 2.1 MHz
- External synchronized clock range: 200 kHz to 400 kHz
- SYNC function
  - SYNC_IN: External clock input
    (Unless inputting clock, this IC operates by internal clock)
- Super-high efficiency by PFM operation
  (When setting MODE pin to a low level)
- Automatic PWM/PFM switching operation and fixed PWM operation are selectable by MODE pin
- Built-in switching FET
- Synchronous current mode architecture
- Shutdown current: Lower than 1 µA
- Quiescent current: 50 µA
- Power Good Monitor
  - Output voltage monitoring by window comparator
  - Power-on reset time: 14 ms
- Soft start time without load dependence: 0.9 ms
  (When switching frequency = 2.1 MHz)
- Enhanced protection functions
  - Input under voltage lockout
  - Output under voltage protection: 92.0%
  - Output over voltage protection: 108.0%
  - Output over current protection
  - Thermal shutdown
- Small ETSSOP16 package (exposed PAD): 5 mm × 6.4 mm
- AEC-Q100 compliant (Grade-1)

Applications

- Advanced driver assistance systems (ADAS)
- Instrument cluster
- Automotive applications
- Industrial applications

7. Functional Description

7.1 Block Description

Input Under Voltage Lockout (Input UVLO)

The input UVLO is the function that prevents a malfunction of this IC from the following status, and protects poststage devices.

- Transitional state at start-up
- Momentary drop of power supply voltage

To prevent such a malfunction, this protection monitors the VIN input voltage and VCC voltage. When either VIN or VCC voltage falls to the UVLO falling threshold, 2.4V (Typ), or lower, the IC stops the VOUT voltage output and becomes UVLO status. When both VIN and VCC voltages reach the UVLO rising threshold, 4.75V (Typ), or higher, the IC is released from the UVLO state and returns to the normal operation.

Output Under Voltage Protection (Output UVP)

The output UVP is the function that monitors the voltage drop of the VOUT pin and notifies by the PG pin.

When the output voltage falls to the UVP falling threshold (P_{GUVPHL}) for the output voltage setting or lower, the PG voltage is fixed to the low level. The IC becomes the UVP status, but the switching operation is maintained under the UVP status.

When the output voltage once again reaches the UVP rising threshold (P_{GUVPLH}) for the output voltage setting or higher, the IC is released from the UVP state and the PG voltage is fixed to the high level.

Output Over Voltage Protection (Output OVP)

The output OVP is the function that monitors the voltage rise of the VOUT pin and stops the switching operations, which protects poststate devices from overvoltage. Also, the VOUT state is notified by the PG pin.

When the output voltage rises to the OVP falling threshold (P_{GOVPLH}) for the output voltage setting or higher, the PG voltage is fixed to the low level. The IC becomes the OVP status, and the switching operations of the High-Side FETs are stopped. When the output voltage once again falls to the OVP falling threshold (P_{GOVPHL}) for the output voltage setting or lower, the IC is released from the OVP state and resumes the switching operations. The PG voltage is fixed to the high level again.

Output Over Current Protection (Output OCP)

The output OCP is the function that limits the excessive current load and protects poststage devices.

Thermal Shutdown (TSD)

The TSD is the function that protects the IC from heat-destruction. When the junction temperature reaches +165°C (Typ), the high-side and low-side switching FET are turned off and the IC becomes the TSD status. When the junction temperature once again falls to +155°C (Typ) or lower, the IC is released from the TSD state and restarts the power supply.

7.2 Protection Function Table

The following table shows the state of each pin when each protection function operates.

Table 7-1 Protection Function Table

Function	ENA Pin Setting	PG Pin Output	DC/DC Converter Operation	Remarks
Shutdown operation	L	Hi-Z (*1)	Shutdown	It is recommended to connect PG pin to VOUT pin via a pull-up resistor. When setting ENA pin to a low level, VOUT pin voltage drops to 0V. Therefore, PG pin outputs 0V.
Nominal operation	H	Hi-Z (*1)	Switching	–
Input under voltage protection (Input UVLO)	H	L	Shutdown	After releasing UVLO state, this IC is automatically reset with soft start.
Output under voltage protection (Output UVP)	H	L	Switching	–
Output over voltage protection (Output OVP)	H	L	Shutdown	–
Output over current protection (Output OCP)	H	L	Switching	OCP operates to drop the output voltage.
Thermal shutdown (TSD)	H	L	Shutdown	After releasing TSD state, this IC is automatically reset with soft start.

*1: PG pin is formed as an open drain structure. The internal MOSFET is in the OFF state.

8. Application Circuit Example and Parts list

*1: The D_{SBD} is necessary only when using at VIN ≤ 3.3V. In addition, since a leakage current (I_R) of the D_{SBD} increases under high temperature, it is necessary to connect a load according to the leakage current of the D_{SBD} to VOUT pin under the automatic PWM/PFM switching operation (MODE = L, SYNC = L).

9. Application Note

9.1 Setting the Operation Conditions

Operation State of DC/DC Convertor

The operation stage of DC/CD converter is set by both MODE pin and SYNC pin.

Table 9-1 Operation State of DC/DC Convertor

MODE Pin	SYNC Pin (Signal Input)	Operation State of DC/DC Convertor
L (*3)	L (*3)	Automatic PWM/PFM switching operation from an internal clock
	External clock input (*5)	Fixed PWM operation with synchronizing signal from an external clock (*2)

H (*4)	L (*3)	Fixed PWM operation from an internal clock
	External clock input (*5)	Fixed PWM operation with synchronizing signal from an external clock (*2)
	H (*4)	Prohibition of use (*1)

*1: When setting SYNC pin to a high level, the quiescent current (I_{VINQ}) is increased.
*2: Set the timing resistance (R_{RT}) to 330 kΩ.
*3: Apply the GND1 or GND2 voltage.
*4: Apply the VOUT voltage.
*5: Apply the VOUT voltage at a high level. Apply the GND1 or GND2 voltage at a low level

Setting of Switching Frequency (Internal Clock)

The switching frequency (internal clock) can be set by RT resistor, which value is the timing resistance (R_{RT}), connected to RT pin. Set the timing resistance in a range within the Figure 9-1. The switching frequency is also limited by VIN input voltage. Set the switching frequency in a range within the Figure 9-2.

Figure 9-1 F_{OSC} vs R_{RT} Measured Characteristic

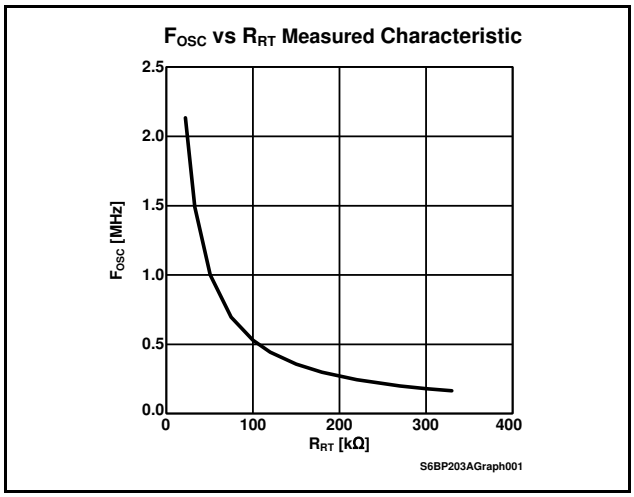

Figure 9-2 Max F_{OSC} vs V_{VIN}

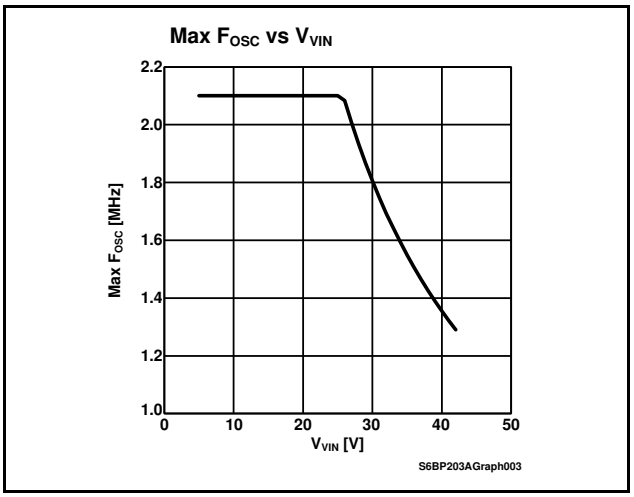

The reference value can be calculated by the following formula.

$$F_{OSC}\,[Hz] \approx \frac{1}{R_{RT} \times 21.7 \times 10^{-12}}$$

F_{OSC} : Switching frequency [Hz]
R_{RT} : Timing resistance [Ω]

Setting of Soft-start Time

The Soft-start time is determined by the timing resistance (R_{RT}), the value of the resistor connected to RT pin.

$$T_{SS}\,[s] = \frac{1}{F_{OSC}} \times 2 \times 1024$$

T_{SS} : Soft-start time [s]

F_{OSC} : Switching frequency [Hz]

Consideration of VOUT Maximum Output Current

Make sure the VOUT maximum output current in a range within the following graph.

11. Usage Precaution

Printed circuit board ground lines should be set up with consideration for common impedance.

Take appropriate measures against static electricity.

- Containers for semiconductor materials should have anti−static protection or be made of conductive material.
- After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
- Work platforms, tools, and instruments should be properly grounded.
- Working personnel should be grounded with resistance of 250 kΩ to 1 MΩ in serial body and ground.

Do not apply negative voltages.

The use of negative voltages below −0.3 V may make the parasitic transistor activated to the LSI, and can cause malfunctions.

12. RoHS Compliance Information

This product has observed the standard of lead, cadmium, mercury, Hexavalent chromium, polybrominated biphenyls (PBB), and polybrominated diphenyl ethers (PBDE).

NOTE:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING & TOLERANCES PER ASME. Y14.5M-1994.
3. DIMENSION 'D' DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.15 PER SIDE.
4. DEMENSION 'E1' DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25 PER SIDE.
5. DIMENSION 'b' DOES NOT INCLUDE DAMBER PROTRUSION.ALLOWABLE DAMBER PROTRUSIONS SHALL BE 0.07mm TOTAL IN EXCESS OF THE 'b' DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBER CANNOT BE LOCATED ON THE LOWER RADIUS OF THE FOOT.MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD SHOULD BE 0.08mm FOR 0.65mm PITCH,0.08mm FOR 0.50mm PITCH AND 0.07mm FOR 0.40mm PITCH PACKAGES.
6. 'N' IS THE MAXIMUM NUMBER OF TERMINAL POSITIONS FOR THE SPECIFIED PACKAGE LENGTH
7. TERMINAL NUMBERS ARE SHOWN FOR REFERENCE ONLY.
8. DATUMS A AND B TO BE DETERMINED AT DATUM PLANE H.
9. DIMENSIONS 'D' AND 'E1' TO BE DETERMINED AT DATUM PLANE H.
10. THIS DIMENSION APPLIES ONLY TO VARIATIONS WITH AN EVEN NUMBER OF LEADS PER SIDE FOR VARIATION WITH AN ODD NUMBER OF LEADS PER SIDE, THE "CENTER" LEAD MUST BE COINCIDENT WITH THE PACKAGE CENTERLINE, DATUM A.
11. CROSS SECTION B-B' TO BE DETERMINED AT 0.10 TO 0.25MM FROM THE LEAD TIP.
12. DIMENSIONS "D1" AND "E2" ARE THERMALLY ENHANCED VARIATIONS. END USER SHOULD VERIFY AVAILABLE SIZE OF EXPOSED PER FOR SPECIFIC DEVICE APPLICATION "D1" AND "E2" DIMENSIONS DO NOT INCLUDE MOLD FLASH.
13. A1 IS DEFINED AS THE VERTICAL CLEARANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.

Document Number: 002-08534

Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	–	HIXT	09/04/2015	New Spec.
*A	5056149	HIXT	12/18/2015	Added Block Diagram Added Figure 14-1 Updated 15. Package Dimensions
*B	5164343	HIXT	03/08/2016	Added “AEC-Q100 compliant (Grade-1)” in Features Added Figure 2-1 I/O Pin Equivalent Circuit Diagram The followings in 6. Electrical Characteristics were updated. The parameter name of I_{VOUT} was changed from ”VOUT output voltage” to “Maximum output current” The max values of I_{VOUT} were moved to the min column. Added 10. Development Support Added 11. Reference Data Deleted the ES part number from Table 14-1
*C	5843027	MASG	08/03/2017	Adapted Cypress new logo.
*D	5909405	HIXT	10/05/2017	Updated to the Cypress naming and format Updated “TSSOP” → “ETSSOP” in Features, Table 13-1 and Figure 13-1 Updated 14 Package Dimensions Added More Information Deleted “10. Development Support” (Moved to More Information) Changed the suffix of the Part Number from “000” to “00A” in Table 13-1 and Figure 13-1
*E	6409930	SSAS	12/13/2018	No change; sunset review.
