

### General Description

The 8INT31H800A is an 8-output very high performance HCSL fanout buffer for High Performance Interconnect applications. It can also be used at speeds up to 350MHz. There are four OE pins on the device, each controlling two outputs.

### Recommended Application

DB800H

### Output Features

- Eight HCSL differential pairs

### Key Specifications

- Qx output-to-output skew within a pair: 22ps (typical)
- Qx output-to-output skew across all outputs: 32ps (typical)
- RMS additive phase jitter: 65fs (typical)

### Features/Benefits

- Extremely low additive phase jitter; supports DB800H requirements
- 3.3V operation; standard industry power supply
- Four OE pins each controlling two outputs; easy control of clocks to CPU sockets
- Universal differential input; can be driven by HCSL or LVPECL clock sources
- 1MHz to 350MHz operating frequency; covers all popular Ethernet frequencies
- Space saving 32-pin 5x5mm VFQFN; minimal board space

### Block Diagram

### Pin Assignment

**32-pin, 5mm x 5mm VFQFN Package**

v prefix indicates internal 50kΩ pull-down resistor

## Pin Descriptions and Characteristics

Table 1. Pin Descriptions

Pin#	Name	Type		Pin Description
1	Q0	Output		Non-inverting output of Differential Pair 0.
2	nQ0	Output		Inverting output of Differential Pair 0.
3	Q1	Output		Non-inverting output of Differential Pair 1.
4	nQ1	Output		Inverting output of Differential Pair 1.
5	Q2	Output		Non-inverting output of Differential Pair 2.
6	nQ2	Output		Inverting output of Differential Pair 2.
7	Q3	Output		Non-inverting output of Differential Pair 3.
8	nQ3	Output		Inverting output of Differential Pair 3.
9	V <sub>DDO3.3</sub>	Power		Power supply for outputs, nominal 3.3V.
10	vOE_67#	Input	Pulldown	Active Low input for enabling outputs 6 and 7. 0 = enable outputs, 1 = disable outputs
11	CLK_IN	Input		True Input for differential reference clock.
12	nCLK_IN	Input		Complementary Input for differential reference clock.
13	GND	GND		Ground pin.
14	V <sub>DD3.3</sub>	Power		Power supply, nominal 3.3V.
15	GNDO	GND		Ground pin for outputs.
16	V <sub>DDO3.3</sub>	Power		Power supply for outputs, nominal 3.3V.
17	nQ7	Output		Inverting output of Differential Pair 7.
18	Q7	Output		Non-inverting output of Differential Pair 7.
19	nQ6	Output		Inverting output of Differential Pair 6.
20	Q6	Output		Non-inverting output of Differential Pair 6.
21	nQ5	Output		Inverting output of Differential Pair 5.
22	Q5	Output		Non-inverting output of Differential Pair 5.
23	nQ4	Output		Inverting output of Differential Pair 4.
24	Q4	Output		Non-inverting output of Differential Pair 4.
25	V <sub>DDO3.3</sub>	Power		Power supply for outputs, nominal 3.3V.
26	GNDO	GND		Ground pin for outputs.
27	IREF	Output		This pin establishes the reference for the differential current-mode output pairs. It requires a fixed precision resistor to ground. 475Ω is the standard value for 100Ω differential impedance. Other impedances require different values. See data sheet.
28	vOE_01#	Input	Pulldown	Active Low input for enabling outputs 0 and 1. 0 = enable outputs, 1 = disable outputs
29	vOE_23#	Input	Pulldown	Active Low input for enabling outputs 2 and 3 0 = enable outputs, 1 = disable outputs
30	vOE_45#	Input	Pulldown	Active Low input for enabling outputs 4 and 5. 0 = enable outputs, 1 = disable outputs
31	GNDO	GND		Ground pin for outputs.
32	V <sub>DDO3.3</sub>	Power		Power supply for outputs, nominal 3.3V.

NOTE 1: V<sub>DDx</sub> denotes either V<sub>DD3.3</sub> or V<sub>DDO3.3</sub>.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 8INT31H800A. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V <sub>DDX</sub>	3.3V Supply Voltage <sup>1</sup>				3.6	V
V <sub>IL</sub>	Input Low Voltage		GND - 0.5			V
V <sub>IH</sub>	Input High Voltage				3.6	V
Outputs (V <sub>O</sub> )					3.6	V
T <sub>S</sub>	Storage Temperature		-65		150	°C
T <sub>J</sub>	Junction Temperature				125	°C
ESD (HBM)	ESD protection <sup>2</sup>	Human Body Model	2000			V
ESD (CDM)		Charged Device Model	1000			V

NOTE 1: V<sub>DDX</sub> denotes either V<sub>DD3.3</sub> or V<sub>DDO3.3</sub>.

NOTE 2: According to JEDEC/JS-001-2012/JESD22-C101E.

## Electrical Characteristics

C <sub>OUT</sub>		Output Pin Capacitance			6	pF
t <sub>LATOE</sub>	OE# Latency <sup>4</sup>	Input Clock must be running	4		12	clocks

NOTE 1: V<sub>DDX</sub> denotes either V<sub>DD3.3</sub> or V<sub>DDO3.3</sub>.

NOTE 2: Guaranteed by design and characterization, not 100% tested in production.

NOTE 3: Signal edge is required to be monotonic when transitioning through this region.

NOTE 4: Time from de-assertion until outputs are stopped or time from assertion until outputs are running.

**Table 3B. Clock Input Parameters, Supply Voltage  $V_{DDX}^1 = 3.3\text{ V} \pm 5\%$ ,  $T_A = T_{IND}$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$V_{PP}$	Peak-to-Peak Voltage	CLK_IN, nCLK_IN	0.3		1.0	V
$V_{CMR}$	Common Mode Input Voltage <sup>2, 3</sup>	CLK_IN, nCLK_IN	GND + 0.3		$V_{DD3.3} - 1$	V
dv/dt	Input Slew Rate <sup>4</sup>	Measured Differentially	0.4		8	V/ns
$I_{IN}$	Input Leakage Current	$V_{IN} = V_{DD3.3}$ , $V_{IN} = \text{GND}$	-5		5	$\mu\text{A}$
$d_{tin}$	Input Duty Cycle	Measurement from Differential Waveform	40		60	%

NOTE 1:  $V_{DDx}$  denotes either  $V_{DD3.3}$  or  $V_{DDO3.3}$ .

NOTE 2: Common mode voltage is defined as the crosspoint.

NOTE 3: Input voltage cannot be less than GND - 300mV or more than  $V_{DD3.3}$ .

NOTE 4: Slew rate measured through  $\pm 75\text{mV}$  window centered around differential zero.

**Table 3C. Qx HCSL Differential Outputs, Supply Voltage  $V_{DDX}^1 = 3.3\text{ V} \pm 5\%$ ,  $T_A = T_{IND}$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
dv/dt	Slew Rate <sup>2, 3</sup>		0.6		4	V/ns
$\Delta\text{Trf}$	Rise/Fall Time Matching <sup>4</sup>	Rise/Fall Time Matching			20	%
$V_{HIGH}$	Voltage High <sup>5</sup>	Statistical Measurement on Single-ended Signal using Oscilloscope Math Function	650		875	mV
$V_{Low}$	Voltage Low <sup>5</sup>		-150		150	mV
$V_{max}$	Max. Voltage <sup>5</sup>	Measurement on Single-ended Signal using Absolute Value			1150	mV
$V_{min}$	Min. Voltage <sup>5</sup>		-300			
$V_{cross\_abs}$	Crossing Voltage (abs) <sup>6</sup>		240		550	mV
$\Delta V_{cross}$	Crossing Voltage (var) <sup>5, 7</sup>				140	mV

NOTE 1:  $V_{DDx}$  denotes either  $V_{DD3.3}$  or  $V_{DDO3.3}$ .

NOTE 2: Measured from differential waveform.

NOTE 3: Slew rate is measured through the  $V_{swing}$  voltage range centered around differential 0V. This results in a  $\pm 150\text{mV}$  window around differential 0V.

NOTE 4: Rise/Fall matching derived using the following,  $2 \cdot (T_{RISE} - T_{FALL}) / (T_{RISE} + T_{FALL})$

NOTE 5: Measured from single-ended waveform.

NOTE 6:  $V_{cross}$  is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

NOTE 7: The total variation of all  $V_{cross}$  measurements in any system. Note that this is a subset of  $V_{cross\_min/max}$  ( $V_{cross}$  absolute) allowed. The intent is to limit  $V_{cross}$  induced modulation by setting  $V_{cross\_delta}$  to be smaller than  $V_{cross}$  absolute.

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500ppm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE: Guaranteed by design and characterization, not 100% tested in production.

**Table 3D. Current Consumption, Supply Voltage  $V_{DDX}^1 = 3.3V \pm 5\%$ ,  $T_A = T_{IND}$** 

Test Conditions	Minimum	Typical	Maximum	Units
All outputs running @ 350MHz		191	225	mA
2 outputs running @ 350MHz other outputs disabled.		84	100	mA
All outputs stopped, input clock running @ 350MHz or stopped.		34	40	mA

NOTE 1:  $V_{DDx}$  denotes either  $V_{DD3.3}$  or  $V_{DDO3.3}$ .**Table 3E. Qx Output Duty Cycle, Jitter, and Skew Characteristics, Supply Voltage  $V_{DDX}^{1,2} = 3.3V \pm 5\%$ ,  $T_A = T_{IND}$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$t_{OCD}$	Output Duty Cycle <sup>3</sup>	Measured Differentially	45		55	%
$t_{PD}$	Skew, Input to Output	$V_T = 50\%$	1		1.6	ns
$t_{SKEWpair}$	Skew, Output to Output	Between Two Output Pairs Controlled by Same OE Pin, $V_T = 50\%$			38	ps
$t_{sk3}$	Skew, Output to Output	Across all Outputs, $V_T = 50\%$		32	80	ps
$t_{jycyc-cycadd}$	Jitter, Cycle to Cycle Additive <sup>4</sup>	Across all Outputs, $V_T = 50\%$ $f_{OUT} = 156.25MHz$			50	ps

NOTE 1:  $V_{DDx}$  denotes either  $V_{DD3.3}$  or  $V_{DDO3.3}$ .

NOTE 2: Guaranteed by design and characterization, not 100% tested in production.

NOTE 3: Input duty cycle = 50%

NOTE 4: Measured from differential waveform.

**Table 3F. Additive Phase Jitter, Supply Voltage  $V_{DDX} = 3.3V \pm 5\%$ ,  $T_A = T_{IND}^{1,2,3}$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$t_{jph}$	Additive Phase Jitter	$f_{OUT} = 156.25MHz$ , All Outputs Running, Integration Range: 12kHz to 20MHz		65	75	fs (RMS)

NOTE 1: Applies to all output

NOTE 2: Signal Source Wenzel Oscillator.

NOTE 3: For RMS figures, additive jitter is calculated by solving the following equation: Additive jitter =  $\sqrt{(\text{total jitter})^2 - (\text{input jitter})^2}$

## HCSL Test Loads

Table 3G. Differential Output Termination Table<sup>1</sup>

DIF $Z_o$ ( $\Omega$ )	IREF ( $\Omega$ )	$R_s$ ( $\Omega$ )	$R_p$ ( $\Omega$ )
100	475	33	50
85	412	27	42.2 or 43.2

NOTE 1: It is recommended to use the components for differential output impedance of  $85\Omega$  for optimal performance.

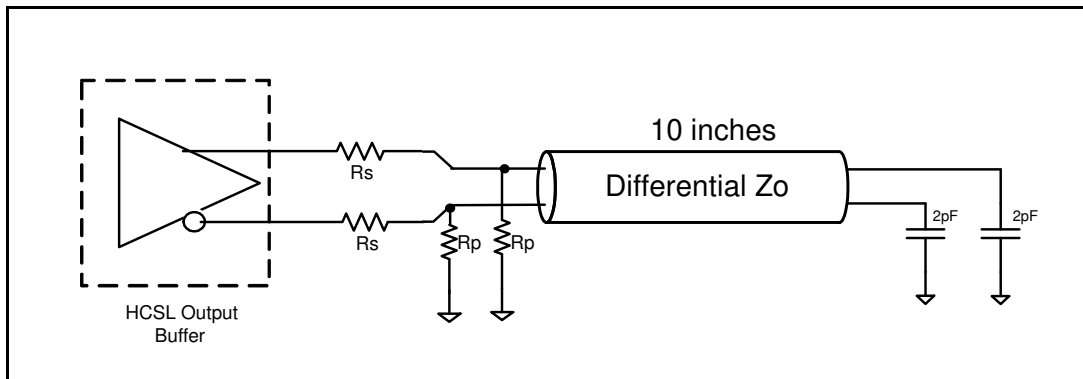

Figure 1. HCSL Test Load

## Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio

of the power in the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

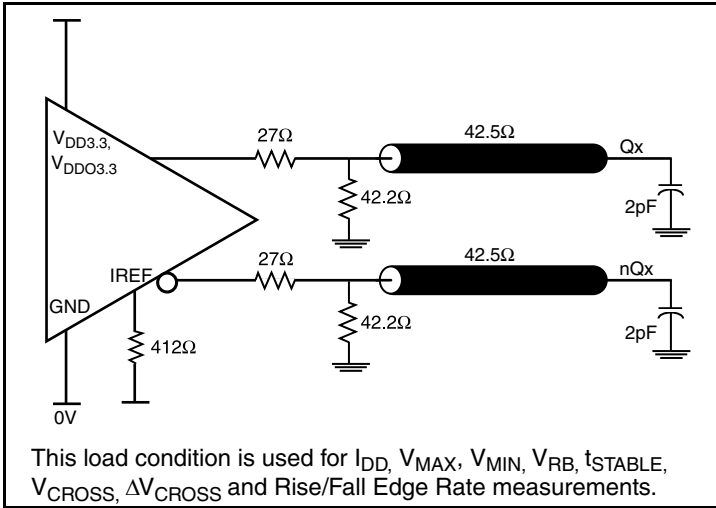

As with most timing specifications, phase noise measurements have issues relating to the limitations of the measurement equipment. The noise floor of the equipment can be higher or lower than the noise floor of the device. Additive phase noise is dependent on both the noise floor of the input source and measurement equipment.

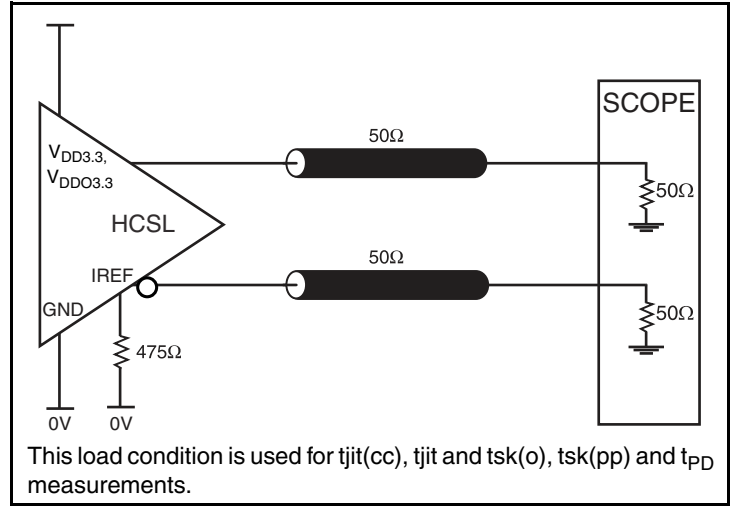

The source generator used is, low noise Wenzel Oscillator at 156.25MHz, and the additive phase jitter for this device was measured using an Agilent E5052 Phase Noise Analyzer.

## Applications Information

### Differential Clock Input Interface

The 8INT31H800A differential clock input CLK\_IN/nCLK\_IN accepts HCSL, LVPECL, LVHSTL and other types of differential signal. The differential input signal must meet both  $V_{swing}$  (amplitude) and  $V_{com}$  (DC offset) input requirement. The CLK\_IN and nCLK\_IN of this part is high input impedance without internal built-in termination. The

termination requirement will depend on the driver type. Please consult with the vendor of the driver component to confirm the driver termination requirement. Figure 2A to Figure 2E show interface examples for the CLK\_IN/nCLK\_IN input driven by the most common driver types.

## Power Considerations

This section provides information on power dissipation and junction temperature for the 8INT31H800A. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 8INT31H800A is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for  $V_{DD3.3} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

The maximum current at 85°C is as follows:

$$I_{DD3.3\_MAX} = 195mA$$

$$I_{DDO3.3\_MAX} = 30mA$$

$$\text{Power (core)}_{MAX} = V_{DD3.3\_MAX} * (I_{DD3.3\_MAX} + I_{DDO3.3\_MAX}) = 3.465V * 225mA = \mathbf{779.625mW}$$

- Power (Output)<sub>MAX</sub> = 38.82mW/Loaded Output pair  
If all outputs are loaded, the total power is  $8 * 38.82mW = 310.56mW$

$$\mathbf{\text{Total Power} = 779.625mW + 310.56mW = 1090.18mW}$$

### 2. Junction Temperature.

Junction temperature,  $T_J$ , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_J$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

$$\text{The equation for } T_J \text{ is as follows: } T_J = \theta_{JA} * Pd_{total} + T_A$$

$T_J$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 33.1°C/W per Table 4 below.

Therefore,  $T_J$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 1.09W * 33.1^\circ\text{C/W} = 121.1^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example.  $T_J$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

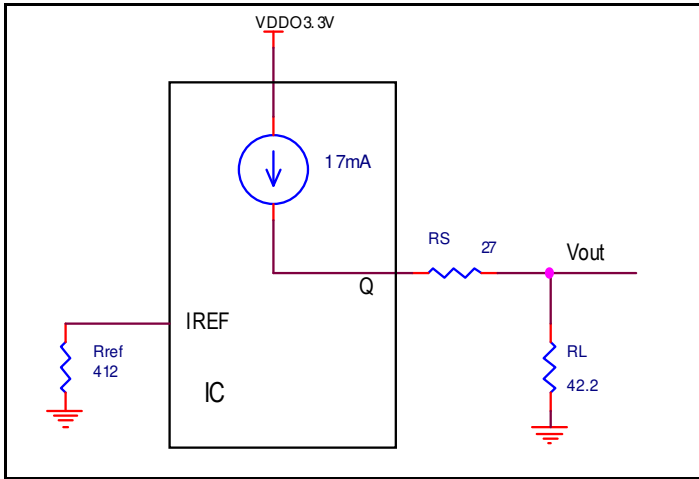

**Table 4. Thermal Resistance  $\theta_{JA}$  for 32 Lead VFQFN, Forced Convection**

Meters per Second	$\theta_{JA}$ by Velocity		
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	33.1°C/W	28.1°C/W	25.4°C/W

### 3. Calculations and Equations

The purpose of this section is to calculate power dissipation on the IC per HCSL output pair.

HCSL output driver circuit and termination are shown in [Figure 3](#).

**Figure 3. HCSL Driver Circuit and Termination**

HCSL is a current steering output which sources a maximum of 17mA of current per output. To calculate worst case on-chip power dissipation, use the following equations which assume a 42.5Ω load to ground.

The highest power dissipation occurs when  $V_{DDO3.3\_MAX}$ .

$$\text{Power} = (V_{DDO3.3\_MAX} - V_{OUT}) * I_{OUT}$$

$$\text{since } V_{OUT} = I_{OUT} * R_L$$

$$= (V_{DDO3.3\_MAX} - I_{OUT} * R_L) * I_{OUT}$$

$$= (3.465V - 17mA * (42.5\Omega + 27\Omega)) * 17mA$$

Total Per Dissipation per output pair = 38.82mW

### Package Outline and Package Dimensions (32-pin VFQFPN, 0.50mm pitch)

Package dimensions are kept current with JEDEC Publication No. 95

Thermal Base EP – exposed thermal pad should be externally connected to GND
