

TET3000 Series

AC-DC / HVDC Front-End Power Supplies

The TET3000 Series is a 3000 Watt AC-DC power-factor-corrected (PFC) or DC/DC power supply that converts standard AC mains power or high voltage DC bus voltages into a main output of 12 VDC for powering intermediate bus architectures (IBA) in high performance and reliability servers, routers, and network switches.

The TET3000-12-069RA meets international safety standards and displays the CE-Mark for the European Low Voltage Directive (LVD).

Key Features & Benefits

- Best-in-class, Titanium efficiency
- Universal input voltage range: 90 300 VAC
- AC input with power factor correction
- DC input voltage range: 180 410 VDC
- Hot-plug capable
- Parallel operation with active current sharing thru analog bus
- Full digital controls for improved performance
- High density design: 31.7 W/in³
- Small form factor: 555 x 69 x 40.5 mm (21.85 x 2.72 x 1.60 in)
- I2C communication interface with Power Management Bus protocol for monitoring, control, and firmware update via bootloader
- Overtemperature, output overvoltage and overcurrent protection
- RoHS Compliant
- 2 Status LEDs: AC OK and DC OK with fault signaling
- Safety-approved to IEC/EN 60950-1 and UL/CSA 60950-1 2nd Ed.
- Three US patents (US 6,970,366 B2; US 8,503,199 B1; US9,166, 498 B2) and three US patents pending

Applications

- High Performance Servers
- Routers
- Networking Switches

2. OVERVIEW

The TET3000-12-069RA is a fully DSP controlled, highly efficient front-end power supply. It incorporates resonant-soft-switching technology and interleaved power trains to reduce component stresses, providing increased system reliability and very high efficiency. With a wide input operating voltage range and minimal linear derating of output power with respect to ambient temperature, the TET3000-12-069RA maximizes power availability in demanding server, switch, and router applications. The power supply is fan cooled and ideally suited for server integration with a matching airflow path.

The PFC stage is digitally controlled using a state-of-the-art digital signal processing algorithm to guarantee best efficiency and unity power factor over a wide operating range.

The DC-DC stage uses soft switching resonant techniques in conjunction with synchronous rectification. An active OR-ing device on the output ensures no reverse load current and renders the supply ideally suited for operation in redundant power systems. The always-on +12V standby output provides power to external power distribution and management controllers. Its protection with an active OR-ing device provides for maximum reliability.

Status information is provided with front-panel LEDs. In addition, the power supply can be monitored and controlled (i.e. fan speed setpoint) via I2C communication interface with Power Management Bus protocol. It allows full monitoring of the supply, including input and output voltage, current, power, and inside temperatures. The same I2C bus supports the bootloader to allow field update of the firmware in the DSP controllers.

Cooling is managed by a fan, controlled by the DSP controller. The fan speed is adjusted automatically depending on the actual power demand and supply temperature and can be overridden through the I2C buses.

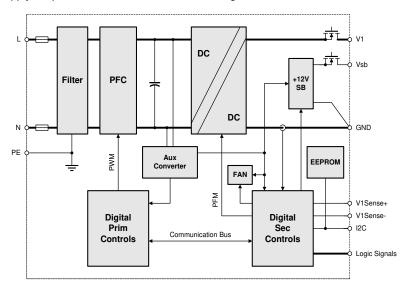

Figure 1. TET3000-12-069RA Block Diagram

3. ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings may cause performance degradation, adversely affect long-term reliability and cause permanent damage to the supply.

Thold	Hold-up Time	After last AC zero point, $V_1 > 10.8V$, V_{SB} within regulation, $V_1 = 230$ VAC, $P_{X nom}$	12	16		ms

²⁾ In HVDC input application, LIVE pin has to be connected to "+" and NEUTRAL has to be connected to "-", Otherwise PSU will have no output

4.1 INPUT FUSE

Quick-acting 25 A input fuses (7×32.7 in mm) in series with both the L- and N-line inside the power supply protect against severe defects. The fuses are not accessible from the outside and are therefore not serviceable parts.

4.2 INRUSH CURRENT

The AC-DC power supply exhibits an X-capacitance of only $4.3~\mu F$, resulting in a low and short peak current, when the supply is connected to the mains. The internal bulk capacitor will be charged through an NTC which will limit the inrush current.

NOTE: Do not repeat plug-in / out operations below 5 sec interval time at maximum input, high temperature condition, or else the internal in-rush current limiting device (NTC) may not sufficiently cool down and excessive inrush current or component failure(s) may result.

4.3 INPUT UNDER-VOLTAGE

If the RMS value of input voltage (either AC or DC) stays below the input undervoltage lockout threshold V_{lon} , the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

4.4 POWER FACTOR CORRECTION

Power factor correction (PFC) (see *Figure 4*) is achieved by controlling the input current waveform synchronously with the input voltage. A fully digital controller is implemented giving outstanding PFC results over a wide input voltage and load ranges. The input current will follow the shape of the input voltage. If for instance the input voltage has a trapezoidal waveform, then the current will also show a trapezoidal waveform. At DC input voltage the PFC is still in operation, but the input current will be DC in this case.

³⁾ The Front-End is provided with a typical hysteresis of 3 V during turn-on and turn-off within the ranges.

4.5 EFFICIENCY

The high efficiency (see *Figure 2*) is achieved by using state-of-the-art GaN power devices in conjunction with soft-transition topologies minimizing switching losses and a full digital control scheme. Synchronous rectifiers on the output reduce the losses in the high current output path. The rpm of the fan is digitally controlled to keep all components at an optimal operating temperature regardless of the ambient temperature and load conditions. *Figure 3* shows efficiency when input voltage is supplied from a high voltage DC source.

5.1 OUTPUT VOLTAGE RIPPLE

Ripple and noise shall be measured using the following methods:

- a) Outputs bypassed at the point of measurement with a parallel combination of 10μF tantalum capacitor in parallel with 0.1μF ceramic capacitors, referring the setup in *Figure 6*.
- b) The ripple voltage is measured with 20 MHz BWL.

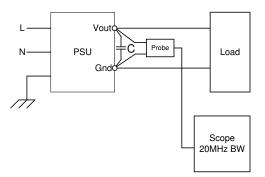

Figure 6. Output Ripple Test Setup

5.2 SHORT TIME OVERLOAD

The main output has the capability to allow load current up to 20% above the nominal output current rating for a maximum duration of 20ms. This allows the system to consume extended power for short time dynamic processes.

5.3 OUTPUT ISOLATION

Main and standby output and all signals are isolated from the chassis and protective earth connection, although the applied voltage must not exceed 100Vpeak to prevent any damage of the supply.

In order to prevent any potential difference in outputs or signals within the application these 3 grounds must be directly interconnected at system level. See also section 14 for pins to be interconnected.

6.1 OVERVOLTAGE PROTECTION

The PSU provide a fixed threshold overvoltage (OV) protection implemented with a HW comparator. Once an OV condition has been triggered, the supply will shut down and latch the fault condition.

6.2 UNDERVOLTAGE DETECTION

Both main and standby outputs are monitored. LED and PWOK_L pin signal if the output voltage exceeds $\pm 7\%$ of its nominal voltage.

Output undervoltage protection is provided on both outputs. When either V_1 or V_{SB} falls below 93% of its nominal voltage, the output is inhibited.

⁵⁾ Limit set doesn't include effects of main output capacitive discharge.

6.3 CURRENT LIMITATION

MAIN OUTPUT

Two different over current protection features are implemented on the main output.

A static over current protection will shut down the output, if the output current does exceed $I_{V1 \text{ lim}}$ for more than 20ms. If the output current is increased slowly this protection will shut down the supply.

The main output current limitation level $I_{V1 lim}$ will decrease if the ambient (inlet) temperature increases beyond 50 °C (see *Figure 20*). Note that the actual current limitation on V_1 will kick in at a current level approximately 10A higher than what is shown in *Figure 20* (see also section 9 for additional information).

The 2^{nd} protection is a substantially rectangular output characteristic controlled by a software feedback loop. This protects the power supply and system during the 20° ms blanking time of the static over current protection. If the output current is rising fast and reaches $I_{V1 \text{ ol lim}}$, the supply will immediately reduce its output voltage to prevent the output current from exceeding $I_{V1 \text{ ol lim}}$. When the output current is reduced below $I_{V1 \text{ ol lim}}$, the output voltage will return to its nominal value.

When the main output over current, the V_1 will shut down for 10sec and restart automatically. The supply will auto-restart from a fault up to 5 times, after that it will latch off. The latch and restart counter can be cleared by recycling the input voltage or the PSON_L input. A failure on the Main output will shut down only the Main output, while Standby continues to operate.

STANDBY OUTPUT

On the standby output a hiccup type over current protection is implemented. This protection will shut down the standby output immediately when standby current reaches or exceeds $k_{\text{SB lim}}$. After an off-time of 1s the output automatically tries to restart. If the overload condition is removed the output voltage will reach again its nominal value. At continuous overload condition the output will repeatedly trying to restart with 1s intervals. A failure on the Standby output will shut down both Main and Standby outputs.

8.2 INTERFACING WITH SIGNALS

A 15V zener diode is added on all signal pins versus signal ground SGND to protect internal circuits from negative and high positive voltage. Signal pins of several supplies running in parallel can be interconnected directly. A supply having no input power will not affect the signals of the paralleled supplies.

ISHARE pins must be interconnected without any additional components. This in-/output also has a 15 V zener diode as a protection device and is disconnected from internal circuits when the power supply is switched off.

8.3 FRONT LEDS

The front-end has 2 front LEDs showing the status of the supply. LED number one is green and indicates AC power is on or off, while LED number two is bi-colored: green and yellow, and indicates DC power presence or fault situations. For the position of the LEDs see *Table 1* lists the different LED status.

OPERATING CONDITION	LED SIGNALING
AC LED	
AC Line Within Range	Solid Green
AC Line UV Condition	Off
DC LED 6)	
Normal Operation	Solid Green
PSON_L High	Blinking Yellow (1:1)
V ₁ or V _{SB} Out Of Regulation	
Over Temperature Shutdown	
Output Over Voltage Shutdown (V ₁ or V _{SB})	Solid Yellow
Output Under Voltage Shutdown (V ₁ or V _{SB})	
Output Over Current Shutdown (V_1 or V_{SB})	
Over Temperature Warning	Blinking Yellow/Green (2:1)
Minor Fan Regulation Error (>5%, <15%)	Blinking Yellow/Green (1:1)

⁶⁾ The order of the criteria in the table corresponds to the testing precedence in the controller.

Table 1. LED Status

8.4 PRESENT L

The PRESENT_L is normally a trailing pin within the connector and will contact only once all other connector contacts are closed. This active-low pin is used to indicate to a power distribution unit controller that a supply is plugged in. The maximum sink current on PRESENT_L pin should not exceed 10 mA.

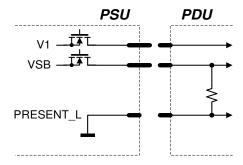

Figure 22. PRESENT_L Signal Pin

8.5 PSKILL INPUT

The PSKILL input is an active-high and normally a trailing pin in the connector and is used to disconnect the main output as soon as the power supply is being plugged out. This pin should be connected to SGND in the power distribution unit. The standby output will remain on regardless of the PSKILL input state.

8.6 AC TURN-ON / DROP-OUTS / INOK_L

The power supply will automatically turn-on when connected to the AC line under the condition that the PSON_L signal is pulled low and the AC line is within range. The INOK_L is an open collector output that requires an external pull-up to a maximum of 12V indicating whether the input is within the range the power supply can use and turn on. The INOK_L signal is active-low. The timing diagram is shown in *Figure 23* and referenced in *Table 2*.

OPERATIN	IG CONDITION	MIN	MAX	UNIT
<i>t</i> AC VSB	AC Line to 90% V/SB		3	sec
<i>t</i> AC V1	AC Line to 90% 1/1		3	sec
tINOK_L on1	INOK_L signal on delay (start-up)		1800	ms
t _{INOK_L on2}	INOK_L signal on delay (dips)	0	100	ms
t√1 holdup	Effective 1/2 holdup time	12	300	ms
tvsB holdup	Effective V _{SB} holdup time	40	300	ms
tinok_L v1	INOK_L to V₁ holdup	7		ms
tinok_L vsb	INOK_L to V _{SB} holdup	27		ms
t√1 off	Minimum 1/₁ off time	1000		ms
tvsB off	Minimum V _{SB} off time	1000		ms
t _{V1dropout}	Minimum V_1 dropout time (0.8*/ _{1 nom})	12		ms
<i>t</i> _{VSBdropout}	Minimum V_{SB} dropout time	40		ms

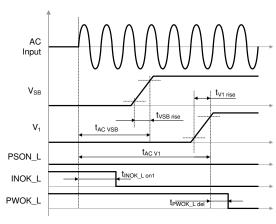

Table 2. AC Turn-on / Dip Timing

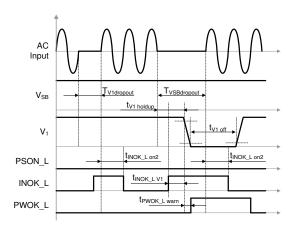

Figure 24. AC Short Dips

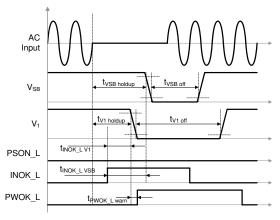

Figure 25. AC Long Dips

8.7 PSON_L INPUT

The PSON_L is an internally pulled- up (3.3V) input signal to enable / disable the main output V_1 of the front-end. This active-low pin is also used to clear any latched fault condition. The timing diagram is given in *Figure 26* and the parameters in *Table 3*.

OPERATING	CONDITION	MIN	MAX	UNIT
tPSON_L V1on	PSON_L to V ₁ Delay (on)	150	250	ms
tPSON_L V1off	PSON_L to V ₁ Delay (off)	0	100	ms

8.8 PWOK_L SIGNAL

The PWOK_L is an open collector output that requires an external pull-up to a maximum of 12 V indicating whether both V_{SB} and V_{1} outputs are within regulation. This pin is active-low. The timing diagram is shown in *Figure 26* and referenced in *Table 4*.

OPERATING CONDITION	MIN	MAX	UNIT
t _{PWOK_L del} <i>V</i> ₁ to PWOK_L Delay (on)	250	350	ms
t _{PWOK_L warn} ¼ to PWOK_L Delay (off)	0	5	ms

Table 4. PWOK_H Timing

Figure 26. PSON_L Turn-on/off Timing

8.9 CURRENT SHARE

The PSU have an active current share scheme implemented for V_1 . All the ISHARE current share pins need to be interconnected in order to activate the sharing function. If a supply has an internal fault or is not turned on, it will disconnect its ISHARE pin from the share bus. This will prevent dragging the output down (or up) in such cases.

The current share function uses an analog bus. The controller implements a Master/Slave current share function. The power supply providing the largest current among the group is automatically the Master. The other supplies will operate as Slaves and increase their output current to a value close to the Master by slightly increasing their output voltage. The voltage increase is limited to +250 mV.

The standby output uses a passive current share method (droop output voltage characteristic).

No of paralleled PSUs	Maximum available power on main 12V without redundancy	Maximum available power on main 12V with n+1 redundancy	Maximum available power on standby output
1	3,000 W	-	36 W
2	5,850 W	3,000 W	36 W
3	8,700 W	5,850 W	36 W
4	11,550 W	8,700 W	36 W
5	14,400 W	11,550 W	36 W
6	17,250 W	14,400 W	36 W

Table 5. Power Available When PSU in Redundant Operation

8.10 SENSE INPUTS

Main output has sense lines implemented to compensate for voltage drop on load wires. The maximum allowed voltage drop is 200 mV on the positive rail and 100 mV on the PGND rail.

With open sense inputs the main output voltage will rise by 250 mV. Therefore, if not used, these inputs should be connected to the power output and PGND close to the power supply connector. The sense inputs are protected against short circuit. In this case the power supply will shut down.

8.11 **I2C / POWER MANAGEMENT BUS COMMUNICATION**

The interface driver in the power supply is referenced to the SGND. The power supply is a communication slave device only; it never initiates messages on the I2Cbuses by itself. The communication bus voltage and timing is defined in Table 6 and further characterized through:

- There are $10k\Omega$ internal pull-up resistors
- The SDA/SCL IOs must be pull-up externally to $3.3 \pm 0.3 V$
- Pull-up resistor should be $2-5 \text{ k}\Omega$ to ensure SMBUS compliant signal rise times
- I2C clock speed up to 100 kbps
- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- Recognizes any time Start/Stop bus conditions

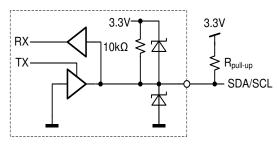

Figure 27. Physical Layer of Communication Interface

The SMB_ALERT_L signal indicates that the power supply is experiencing a problem that the system agent should investigate. This is a logical OR of the Shutdown and Warning events.

Communication to the DSP or the EEPROM will be possible as long as the input AC (DC) voltage is provided. If no AC (DC) is present, communication to the unit is possible as long as it is connected to a live V_{SB} output (provided e.g. by the redundant unit). If only V_1 is provided, communication is not possible.

8.12 ADDRESS SELECTION

The supply supports Power Management Bus communication protocol, address for Power Management Bus communication is at fixed to 0x20. The EEPROM is at fixed address = 0xA0.

8.13 CONTROLLER AND EEPROM ACCESS

The controller and the EEPROM in the power supply share the same I²C bus physical layer (see *Figure 29*). In order to write to the EEPROM, the write protection needs to be disabled by setting EEPROM_WP input correctly. If EEPROM_WP is High, write is not allowed to the EEPROM and if Low, write is allowed. The EEPROM provides 2K bits of user memory. None of the bytes are used for the operation of the power supply.

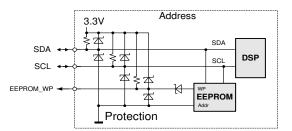

Figure 29. FC Bus to DSP and EEPROM

8.14 EEPROM PROTOCOL

The EEPROM follows the industry communication protocols used for this type of device. Even though page write / read commands are defined, it is recommended to use the single byte write / read commands.

WRITE

The write command follows the SMBus 1.1 Write Byte protocol. After the device address with the write bit cleared a first byte with the data address to write to is sent followed by the data byte and the STOP condition. A new START condition on the bus should only occur after 5ms of the last STOP condition to allow the EEPROM to write the data into its memory.

READ

The read command follows the SMBus 1.1 Read Byte protocol. After the device address with the write bit cleared the data address byte is sent followed by a repeated start, the device address and the read bit set. The EEPROM will respond with the data byte at the specified location.

8.15 POWER MANAGEMENT BUS PROTOCOL

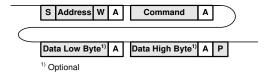

The Power Management Bus (Power Management Bus) is an open standard protocol that defines means of communicating with power conversion and other devices. For more information, please see the System Management Interface Forum web site at: www.powerSIG.org.

Power Management Bus command codes are not register addresses. They describe a specific command to be executed. TET3000-12-069RA supply supports the following basic command structures:

- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- Recognized any time Start/Stop bus conditions

WRITE

The write protocol is the SMBus 1.1 Write Byte/Word protocol. Note that the write protocol may end after the command byte or after the first data byte (Byte command) or then after sending 2 data bytes (Word command).

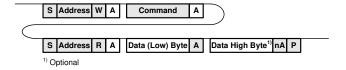

In addition, Block write commands are supported with a total maximum length of 255 bytes. See TET3000-12-069RA Programming Manual for further information.

READ

The read protocol is the SMBus 1.1 Read Byte/Word protocol. Note that the read protocol may request a single byte or word.

In addition, Block read commands are supported with a total maximum length of 255 bytes. See TET3000-12-069RA Power Management Bus Communication Manual URP.00560 for further information.

8.16 GRAPHICAL USER INTERFACE

Bel Power Solutions provides I²C Utility" a Windows® XP/Vista/Win7 compatible graphical user interface allowing the programming and monitoring of the TET3000-12-069RA Front-End. The utility can be downloaded on befuse.com/lpower-solutions and supports both the PSMI and Power Management Bus protocols.

The GUI allows automatic discovery of the units connected to the communication bus and will show them in the navigation tree. In the monitoring dialog, the power supply can be controlled and monitored.

If the GUI is used in conjunction with the TET3000-12-069RA Evaluation Kit it is also possible to control the PSON_L pin(s) of the power supply.

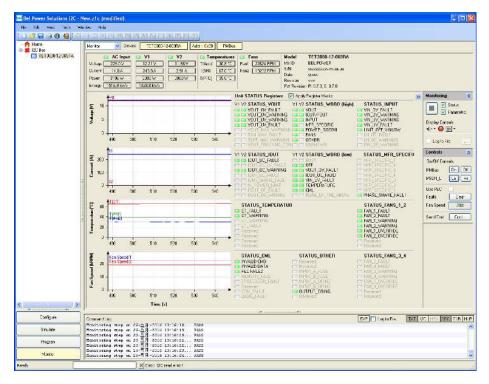

Figure 30. Monitoring dialog of the I²C Utility

9. TEMPERATURE AND FAN CONTROL

To achieve best cooling results sufficient airflow through the supply must be ensured. Do not block or obstruct the airflow at the rear of the supply by placing large objects directly at the output connector. The air enters through the front of the supply and leaves at the rear. The PSU has been designed for horizontal operation.

The fan inside of the supply is controlled by a microprocessor. The rpm of the fan is adjusted to ensure optimal supply cooling and is a function of output power and the inlet temperature.

10.2 EMISSION

PARAMETER	DESCRIPTION / CONDITION	CRITERION
Conducted Emission	EN55022 / CISPR 22: 0.15 30 MHz, QP and AVG	Class A
Radiated Emission	EN55022 / CISPR 22: 30 MHz 1 GHz, QP	Class A
Harmonic Emissions	IEC61000-3-2, Vin = 230 VAC, 50 Hz, 100% Load	Class A
AC Flicker	IEC / EN 61000-3-3, $d_{max} < 3.3\%$	Pass
Acoustical Noise	Sound power statistical declaration (ISO 9296, ISO 7779, IS9295) @ 50% load	60 dBA

11. SAFETY / APPROVALS

Maximum electric strength testing is performed in the factory according to IEC/EN 60950, and UL 60950. Input-to-output electric strength tests should not be repeated in the field. Bel Power Solutions will not honor any warranty claims resulting from electric strength field tests.

PARAMETER	DESCRIPTION / CONDITION	MIN NOM I	MAX UNIT
Agency Approvals	UL 60950-1 Second Edition CAN/CSA-C22.2 No. 60950-1-07 Second Edition IEC 60950-1:2005 EN 60950-1:2006	Approved by independent bod (see CE Declaration	•
	Input (L/N) to case (PE)	Basic	
Isolation Strength	Input (L/N) to output	Reinforced	
	Output to case (PE)	Functional	
Croopage / Clearance	Primary (L/N) to protective earth (PE)	3.8/2.3	mm
Creepage / Clearance	Primary to secondary	7.6/4.6	mm
	Input to case	2.8	
Electrical Strength Test	Input to output	4.3	kVDC
	Output and Signals to case	0.1	

12. ENVIRONMENTAL

PARA	METER	DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
τ	Ambient Temperature	$V_{i min}$ to $V_{i max}$, $I_{i nom}$, $I_{SB nom}$ at 5000m	0		+40	°C
T_{A}		$V_{i min}$ to $V_{i max}$, $I_{1 nom}$, $I_{SB nom}$ at 2000m	0		+50	°C
7 _{Aext}	Extended Temp. Range	Derated output (see Figure 20 and Figure 33) at 2000 m	+50		+60	°C
$\mathcal{T}_{\mathcal{S}}$	Storage Temperature	Non-operational	-40		+70	°C
	Altitude	Operational, above Sea Level (see derating)	-		5000	m
N a	Audible Noise	$V_{1 \text{ nom}}$, 60% $I_{0 \text{ nom}}$, $T_{A} = 25^{\circ}\text{C}$		53		dBA
	Cooling	System Back Pressure			0.5	in-H ₂ 0

13. MECHANICAL

PARAMETER	DESCRIPTION / CONDITION	MIN	NOM	MAX	UNIT
	Width		69		mm
Dimensions	Height		40.5		mm
	Depth		555		mm
M Weight			2.4		kg

14. CONNECTORS

Unit: FCI Connectors P/N 51939-768LF
Counterpart: FCI Connectors P/N 51915-401LF
For Main Output Pins, see section 15

Note: A1 and A2 are Trailing Pin (short pins)

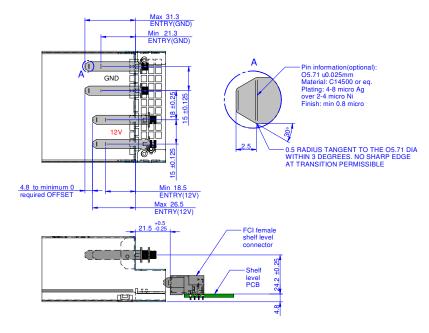

PIN	NAME	DESCRIPTION
Output Pins		
3,4	V1	+12 VDC main output
1,2	PGND	+12 VDC main output ground
Input Pins		
P1	LIVE	AC Live Pin
P2	N.C	No metal pin connection
P3	NEUTRAL	AC Neutral Pin
P4	N.C.	No metal pin connection
P5	P.E.	Protective Earth Pin
Control Pins		
A1	PSKILL	Power supply kill (trailing pin): active-high
B1	PWOK_L	Power OK signal output: active-low
C1	INOK_L	Input OK signal: active-low
D1	PSON_L	Power supply on input: active-low
A2	PRESENT_L	Power supply present (trailing pin): active-low
B2	SGND	Signal ground ⁸⁾ (return)
C2	SGND	Signal ground ⁸⁾ (return)
D2	SGND	Signal ground ⁸⁾ (return)
A3	SCL	I ² C clock signal line
B3	SDA	I ² C data signal line
C3	SMB_ALERT_L	SMB Alert signal output: active-low
D3	ISHARE	V ₁ Current share bus
A4	EEPROM_WP	EEPROM write protect
B4	RESERVED	Reserved
C4	V1_SENSE_R	Main output negative sense
D4	V1_SENSE	Main output positive sense
A 5	VSB	Standby positive output
B5	VSB	Standby positive output
C5	VSB_GND	Standby Ground ⁸⁾
D5	VSB_GND	Standby Ground ⁸⁾

⁸⁾ These pins should be connected to PGND on the system. See section 8 for pull up resistor settings of signal pins All signal pins are referred to SGND

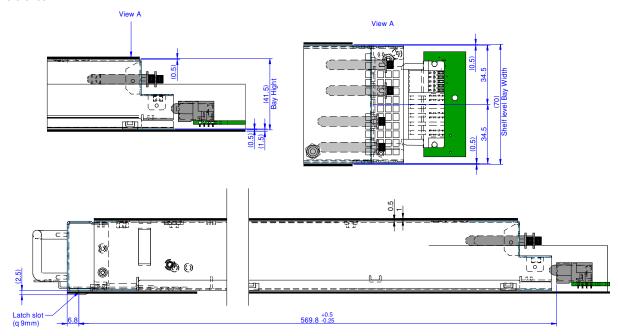

15. SHELF LEVEL CONFIGURATION (Provisional)

The recommended pin configuration below is based on company's own Shelf design and provided here as reference. Customer pin lengths within the range indicated is acceptable.

The recommended system bay configuration below is based on company's own Shelf design and provided here as a reference.
