## Universal Serial Bus Transceiver

### General Description

The USB1T11A is a one chip generic USB transceiver. It is designed to allow 5.0V or 3.3V programmable and standard logic to interface with the physical layer of the Universal Serial Bus. It is capable of transmitting and receiving serial data at both full speed (12Mbit/s) and low speed (1.5Mbit/s) data rates.

The input and output signals of the USB1T11A conform with the "Serial Interface Engine". Implementation of the Serial Interface Engine along with the USB1T11A allows the designer to make USB compatible devices with off-the-shelf logic and easily modify and update the application.

### Features

- Complies with Universal Serial Bus specification 1.1
- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports 12Mbit/s "Full Speed" and 1.5Mbit/s "Low Speed" serial data transmission
- Compatible with the VHDL "Serial Interface Engine" from USB Implementers' Forum
- Supports single-ended data interface
- Single 3.3V supply
- ESD Performance: Human Body Model  
> 9.5 kV on D-, D+ pins only  
> 4 kV on all other pins
- 16-lead Pb-Free MLP package saves space

**Pin Descriptions**

Pin Name	I/O	Description																														
RCV	O	Receive data. CMOS level output for USB differential input																														
$\overline{OE}$	I	Output Enable. Active LOW, enables the transceiver to transmit data on the bus. When not active the transceiver is in receive mode.																														
MODE	I	Mode. When left unconnected, a weak pull-up transistor pulls it to $V_{CC}$ and in this GND, the VMO/FSEO pin takes the function of FSEO (Force SEO).																														
$V_{PO}, V_{MO}/F_{SEO}$	I	Inputs to differential driver. (Outputs from SIE).
