

# FAN73894 3-Phase Half-Bridge Gate-Drive IC

## Features

- Floating Channel for Bootstrap Operation to +600 V
- Typically 350 mA/650 mA Sourcing/Sinking Current-Driving Capability for All Channels
- Extended Allowable Negative  $V_S$  Swing to -9.8 V for Signal Propagation at  $V_{DD}=V_{BS}=15$  V
- Outputs Out of Phase with Input Signals
- Over-Current Shutdown Turns Off All Six Drivers
- Matched Propagation Delay for All Channels
- 3.3 V and 5.0 V Input Logic Compatible
- Adjustable Fault-Clear Timing
- Signal Interlocking of Every Phase to Prevent Cross-Conduction
- Common-Mode  $dV_S/dt$  Noise-Canceling Circuit
- Built-in Advanced Input Filter
- Built-in Soft Turn-Off Function
- Built-in Under-Voltage Lockout (UVLO) Functions for All Channels

## Description

The FAN73894 is a monolithic three-phase half-bridge gate-drive IC designed for high-voltage, high-speed, driving MOSFETs and IGBTs operating up to +600 V.

Fairchild's high-voltage process and common-mode noise-canceling technique provide stable operation of high-side drivers under high- $dV_S/dt$  noise circumstances.

An advanced level-shift circuit allows high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V.

The protection functions include under-voltage lockout, inter-lock function and inverter over-current trip with an automatic fault-clear function. Over-current protection that terminates all six outputs can be derived from an external current-sense resistor. An open-drain fault signal is provided to indicate that an over-current or under-voltage shutdown has occurred. The UVLO circuits prevent malfunction when  $V_{DD}$  and  $V_{BS}$  are lower than the threshold voltage.

Output drivers typically source and sink 350 mA and 650 mA, respectively; which is suitable for three-phase half-bridge applications in motor drive systems.

## Applications

- 3-Phase Motor Inverter Driver
- Air Conditioner, Washing Machine, Refrigerator, Dish Washer
- Industrial Inverter – Sewing Machine, Power Tool
- General-Purpose Three-Phase Inverter

### 28-SOIC

## Ordering Information

Part Number	Package	Operating Temperature	Packing Method
FAN73894MX <sup>(1)</sup>	28-Lead, Small Outline Integrated Circuit, (SOIC)	-40 to +125°C	Tape & Reel

### Note:

1. These devices passed wave-soldering test by JESD22A-111.

### Typical Application Diagram

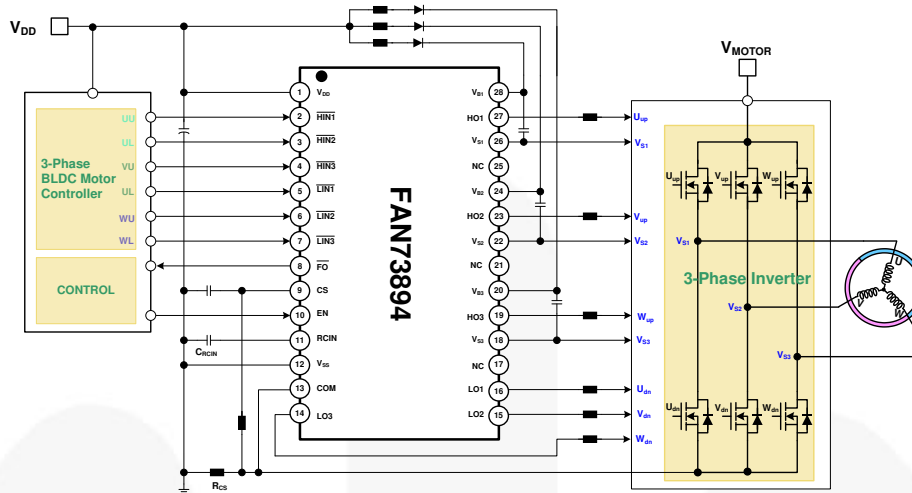

Figure 1. 3-Phase BLDC Motor Drive Application

## Pin Configuration

Figure 3. Pin Assignments

## Pin Definitions

Pin	Name	Description
1	$V_{DD}$	Logic and low-side gate driver power supply voltage
2	$\overline{HIN1}$	Logic Input 1 for high-side gate 1 driver
3	$\overline{HIN2}$	Logic Input 2 for high-side gate 2 driver
4	$\overline{HIN3}$	Logic Input 3 for high-side gate 3 driver
5	$\overline{LIN1}$	Logic Input 1 for low-side gate 1 driver
6	$\overline{LIN2}$	Logic Input 2 for low-side gate 2 driver
7	$\overline{LIN3}$	Logic Input 3 for low-side gate 3 driver
8	$\overline{FO}$	Fault output with open drain (indicates over-current and low-side under-voltage)
9	CS	Analog input for over-current shutdown
10	EN	Logic input for shutdown functionality
11	RCIN	An external RC network input used to define the fault-clear delay
12	$V_{SS}$	Logic ground
13	COM	Low-side driver return
14	LO3	Low-side gate driver 3 output
15	LO2	Low-side gate driver 2 output
16	LO1	Low-side gate driver 1 output
17, 21, 25	NC	No connect
18	$V_{S3}$	High-side driver 3 floating supply offset voltage
19	HO3	High-side driver 3 gate driver output
20	$V_{B3}$	High-side driver 3 floating supply
22	$V_{S2}$	High-side driver 2 floating supply offset voltage
23	HO2	High-side driver 2 gate driver output
24	$V_{B2}$	High-side driver 2 floating supply
26	$V_{S1}$	High-side driver 1 floating supply offset voltage
27	HO1	High-side driver 1 gate driver output
28	$V_{B1}$	High-side driver 1 floating supply

## Absolute Maximum Ratings

Stresses exceeding the Absolute Maximum Ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.  $T_A=25^{\circ}\text{C}$ , unless otherwise specified.

Symbol	Parameter	Min.	Max.	Unit
$V_S$	High-Side Floating Offset Voltage	$V_{B1,2,3}-25$	$V_{B1,2,3}+0.3$	V
$V_B$	High-Side Floating Supply Voltage	-0.3	625.0	V
$V_{DD}$	Low-Side and Logic-Fixed supply voltage	-0.3	25.0	V
$V_{HO}$	High-Side Floating Output Voltage $V_{HO1,2,3}$	$V_{S1,2,3}-0.3$	$V_{B1,2,3}+0.3$	V
$V_{LO}$	Low-Side Floating Output Voltage $V_{LO1,2,3}$	-0.3	$V_{DD}+0.3$	V
$V_{IN}$	Input Voltage ( $\overline{HINx}$ , $\overline{LINx}$ , CS, and EN) <sup>(2)</sup>	$V_{SS} - 0.3$	$V_{SS} + 5.5$	V
$V_{FO}$	Fault Output Voltage ( $\overline{FO}$ )	-0.3	$V_{DD}+0.3$	V
dVs/dt	Allowable Offset Voltage Slew Rate		$\pm 50$	V/ns
$P_D$	Power Dissipation <sup>(3,4)</sup>		1.4	W
$\theta_{JA}$	Thermal Resistance		70	$^{\circ}\text{C}/\text{W}$
$T_J$	Junction Temperature		150	$^{\circ}\text{C}$
$T_{STG}$	Storage Temperature	-55	150	$^{\circ}\text{C}$

### Notes:

- All input voltage ( $\overline{HINx}$  ,  $\overline{LINx}$  , CS, and EN) are referenced to  $V_{SS}$  and do not exceed maximum voltage rating.
- Mounted on 76.2 x 114.3 x 1.6mm PCB (FR-4 glass epoxy material). Refer to the following standards:  
*JESD51-2: Integral circuit's thermal test method environmental conditions, natural convection;*  
*JESD51-3: Low effective thermal conductivity test board for leaded surface-mount packages.*
- Do not exceed maximum power dissipation ( $P_D$ ) under any circumstances.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Max.	Unit
$V_{B1,2,3}$	High-Side Floating Supply Voltage	$V_{S1,2,3}+10$	$V_{S1,2,3}+20$	V
$V_{S1,2,3}$	High-Side Floating Supply Offset Voltage	$6-V_{DD}$	600	V
$V_{DD}$	Low-Side and Logic Fixed Supply Voltage	12	20	V
$V_{HO1,2,3}$	High-Side Output Voltage	$V_{S1,2,3}$	$V_{B1,2,3}$	V
$V_{LO1,2,3}$	Low-Side Output Voltage	COM	$V_{DD}$	V
$V_{FO}$	Fault Output Voltage ( $\overline{FO}$ )	$V_{SS}$	$V_{DD}$	V
$V_{CS}$	Current-Sense Pin Input Voltage	$V_{SS}$	$V_{SS} + 5$	V
$V_{IN}$	Logic Input Voltage ( $\overline{HIN1,2,3}$ and $\overline{LIN1,2,3}$ )	$V_{SS}$	$V_{SS} + 5$	V
$V_{SS}$	Logic Ground	-5	5	V
$T_A$	Ambient Temperature	-40	+125	$^{\circ}\text{C}$

## Electrical Characteristics

$V_{BIAS}$  ( $V_{DD}$ ,  $V_{BS1,2,3}$ ) = 15.0 V and  $T_A$  = 25°C unless otherwise specified. The  $V_{IN}$  and  $I_{IN}$  parameters are referenced to  $V_{SS}$  and are applicable to all six channels. The  $V_O$  and  $I_O$  parameters are referenced to  $V_{S1,2,3}$  and COM and are applicable to the respective output leads: HO1,2,3 and LO1,2,3. The  $V_{DDUV}$  parameters are referenced to  $V_{SS}$ . The  $V_{BSUV}$  parameters are referenced to  $V_{S1,2,3}$ .

$R_{DSFO}$	Fault Output On Resistance	$I_{FO}=1.5$ mA	90	130	170	Ω

**Note:**

5. These parameters are guaranteed by design.

## Dynamic Electrical Characteristics

$T_A=25^\circ\text{C}$ ,  $V_{BIAS}$  ( $V_{DD}$ ,  $V_{BS1,2,3}$ ) = 15.0 V,  $V_{S1,2,3} = \text{COM} = V_{SS}$ ,  $C_{RCIN}=2$  nF, and  $C_{Load} = 1000$  pF unless otherwise specified.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_{ON}$	Turn-On Propagation Delay	$V_{LIN1,2,3}=V_{HIN1,2,3}=0$ V, $V_{S1,2,3}=0$ V	350	500	650	ns
$t_{OFF}$	Turn-Off Propagation Delay	$V_{LIN1,2,3}=V_{HIN1,2,3}=5$ V, $V_{S1,2,3}=0$ V	350	500	650	ns
$t_R$	Turn-On Rise Time	$V_{LIN1,2,3}=V_{HIN1,2,3}=0$ V	20	50	100	ns
$t_F$	Turn-Off Fall Time	$V_{LIN1,2,3}=V_{HIN1,2,3}=5$ V	10	30	80	ns
$t_{EN}$	Enable LOW to Output Shutdown Delay		400	500	600	ns
$t_{CSBLT}$	CS Pin Leading-Edge Blanking Time		400	650	850	ns
$t_{CSFO}$	Time from CS Triggering to $\overline{FO}$	From $V_{CSC}=1$ V to $\overline{FO}$ Turn-Off		850	1300	ns
$t_{CSOFF}$	Time from CS Triggering to Low-Side Gate Outputs Turn-Off	From $V_{CSC}=1$ V to Starting Gate Turn-Off		850	1300	ns
$t_{FLTIN}$	Input Filtering Time <sup>(6)</sup> ( $\overline{HINx}$ , $\overline{LINx}$ , $\overline{EN}$ )		170	250	330	ns
$t_{FLTCLR}$	Fault-Clear Time	$C_{RCIN} = 2$ nF		1.30	2.35	ms
DT	Dead Time		230	320	400	ns
MDT	Dead-Time Matching (All Six Channels)				50	ns
MT	Delay Matching (All Six Channels)				50	ns
PM	Output Pulse-Width Matching <sup>(7)</sup>	$PW_{IN} > 1$ μs		50	100	ns

**Notes:**

6. The minimum width of the input pulse should exceed 500 ns to ensure the filtering time of the input filter is exceeded.  
 7. PM is defined as  $PW_{IN}-PW_{OUT}$ .

### Switching Time Definitions

Figure 34. Switching Time Waveform Definitions

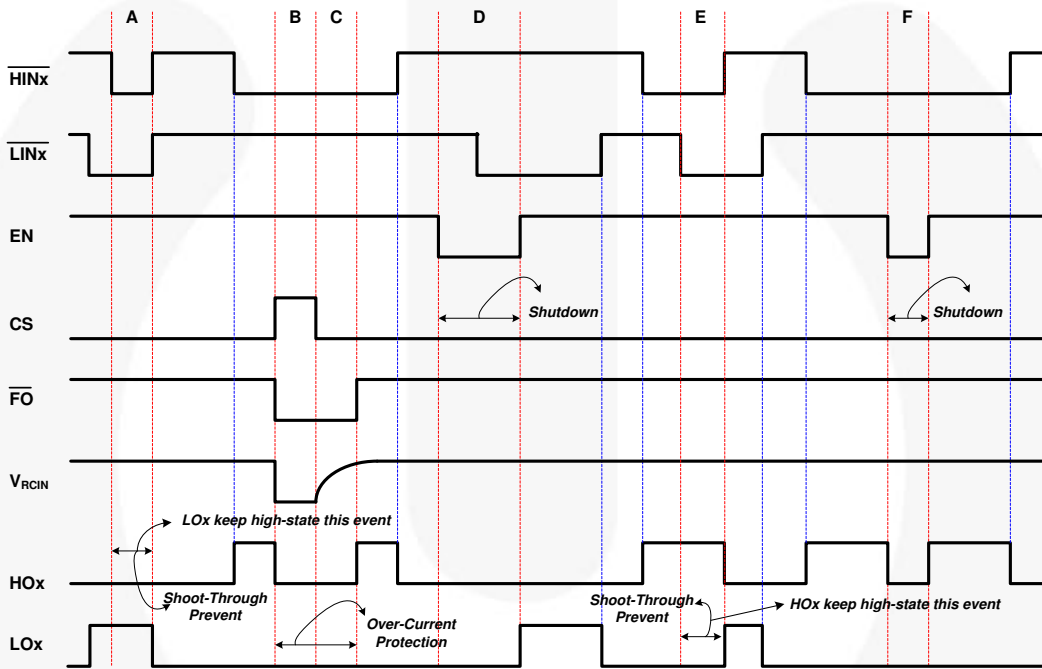

Figure 35. Input / Output Timing Diagram

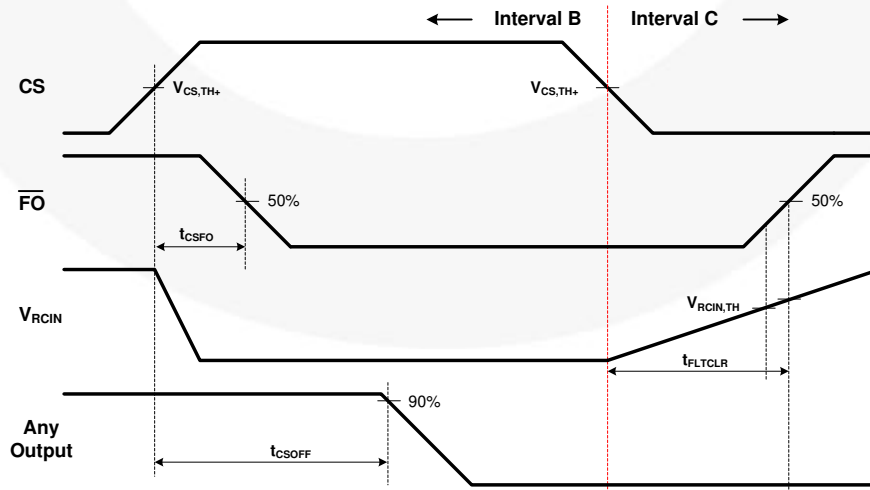

Figure 36. Detailed View of B and C Intervals During Over-Current Protection

## Applications Information

### 1. Dead Time

Dead time is automatically inserted whenever the dead time of the external two input signals (between  $\overline{\text{HINx}}$  and  $\overline{\text{LINx}}$  signals) is shorter than internal fixed dead times ( $\text{DT1}$  and  $\text{DT2}$ ). Otherwise, external dead times larger than internal dead times are not modified by the gate driver and internal dead-time waveform definition is shown in Figure 37.

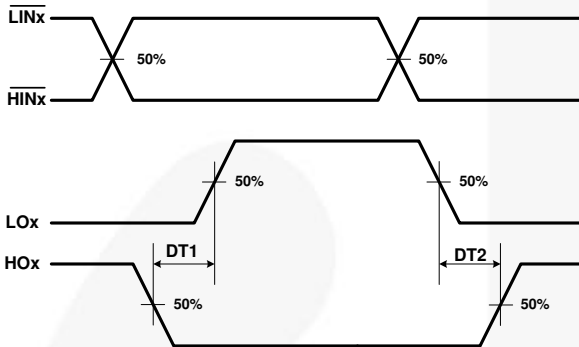

Figure 37. Internal Dead-Time Definitions

### 2. Protection Function

#### 2.1 Fault Out ( $\overline{\text{FO}}$ ) and Under-Voltage Lockout

The high- and low-side drivers include under-voltage lockout (UVLO) protection circuitry that monitors the supply voltage for  $V_{\text{DD}}$  and  $V_{\text{BS}}$  independently. It can be designed to prevent malfunction when  $V_{\text{DD}}$  and  $V_{\text{BS}}$  are lower than the specified threshold voltage. The UVLO hysteresis prevents chattering during power-supply transitions. Moreover, the fault signal (power supply voltage  $\overline{\text{FO}}$ ) goes to LOW state to operate reliably during power-on events when the power supply ( $V_{\text{DD}}$ ) is below the under-voltage lockout high threshold voltage for the circuit (during  $t_1 \sim t_2$ ). The UVLO circuit is not otherwise activated; shown Figure 38. If  $V_{\text{DD}}$  is lower than 3.5V, the fault signal cannot be driven to LOW state because  $V_{\text{DD}}$  is not enough to drive internal circuit.

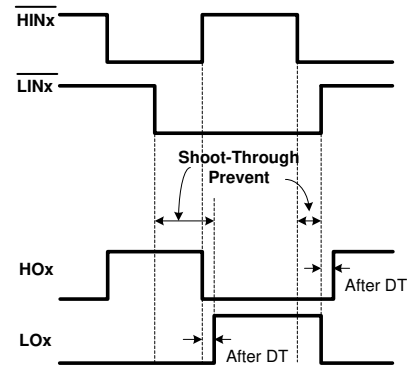

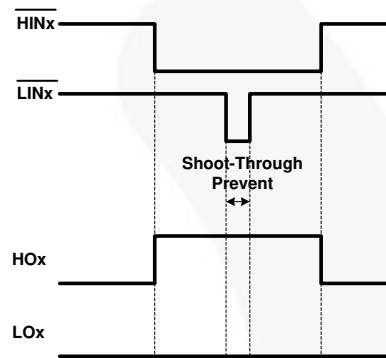

Figure 38. Waveforms for Under-Voltage Lockout

#### 2.2 Shoot-Through Protection

The shoot-through protection circuitry prevents both high- and low-side switches from conducting at the same time, as shown Figure 39.

Example A

Example B

Figure 39. Shoot-Through Protection

An interlock function is a device used to prevent both high- and low-side switches from conducting at the same time as shown Figure 40. In most applications an interlock is used to help prevent a device from harming its operator or damaging itself by when two input signals of a same leg are activated simultaneously, only one output is activated.

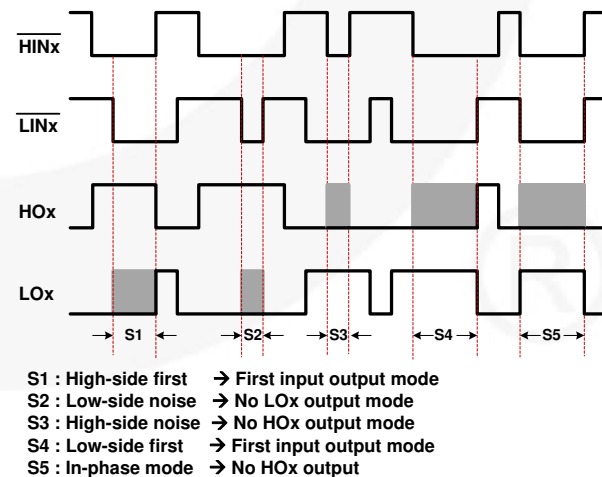

Figure 40. Interlock Function

### 2.3 Enable Input

When the EN pin is in HIGH state, the gate driver operates normally. When a condition occurs that should shut down the gate driver, the EN pin should be LOW. The enable circuitry has an input filter; the minimum input duration is specified by  $t_{FLTIN}$  (typically 250 ns).

**Figure 41. Output Enable Timing Waveform**

### 2.4 Fault-Out ( $\overline{FO}$ ) and Over-Current Protection

FAN73894 provides an integrated fault output ( $\overline{FO}$ ) and an adjustable fault-clear timer ( $t_{FLTCLR}$ ). There are two situations that cause the gate driver to report a fault via the  $\overline{FO}$  pin. The first is an under-voltage condition of low-side gate driver supply voltage ( $V_{DD}$ ) and the second is when the current-sense pin ( $CS$ ) recognizes a fault. If a fault condition occurs, the  $\overline{FO}$  pin is internally pulled to COM and all outputs ( $HO1, 2, 3$  and  $LO1, 2, 3$ ) of the gate driver are turned off. The fault output stays LOW until the fault-clear timer expires. Once the fault-clear timer expires, the voltage on the  $\overline{FO}$  pin returns to pull-up voltage.

The fault-clear time ( $t_{FLTCLR}$ ) is determined by an internal current source ( $I_{RCIN}=5 \mu A$ ) and an external  $C_{RCIN}$  at the  $RCIN$  pin, as shown as:

$$t_{FLTCLR} = \frac{C_{RCIN} \times V_{RCIN,TH}}{I_{RCIN}} [s] \quad (1)$$

The  $R_{DSRCIN}$  of the MOSFET is a characteristic discharge curve with respect to the external capacitor  $C_{RCIN}$ . The time constant is defined by the external capacitor  $C_{RCIN}$  and the  $R_{DSRCIN}$  of the MOSFET.

The output of current-sense comparator ( $CS\_COMP$ ) passes a noise filter, which inhibits an over-current shutdown caused by parasitic voltage spikes of  $V_{CS}$ .

This corresponds to a voltage level at the comparator of  $V_{CSTH+} - V_{CSHYS} = 500 \text{ mV} - 60 \text{ mV} = 440 \text{ mV}$ , where  $V_{CSHYS}=60 \text{ mV}$  is the hysteresis of the current comparator ( $CS\_COMP$ ), as shown in Figure 42.

**Figure 42. Over-Current Protection**

Figure 43 shows the waveform definitions of  $RCIN$ ,  $\overline{FO}$ , and the low-side driver; which uses a soft turn-off method when an under-voltage condition of the low-side gate driver supply voltage ( $V_{DD}$ ) or the current-sense pin ( $CS$ ) recognizes a fault. If a fault condition occurs, the  $\overline{FO}$  Pin is internally pulled to COM and all outputs ( $HO1,2,3$  and  $LO1,2,3$ ) of the gate driver are turned off. Low-side outputs decline linearly by the internal sink current source ( $I_{SOFT}=40 \text{ mA}$ ) for soft turn-off, as shown in Figure 43.

**Figure 43.  $RCIN$  and Fault-Clear Waveform Definition**

## 3. Noise Filter

### 3.1 Input Noise Filter

Figure 44 shows the input noise filter method, which has symmetry duration between the input signal ( $t_{INPUT}$ ) and the output signal ( $t_{OUTPUT}$ ) and helps to reject noise spikes and short pulses. This input filter is applied to the  $HINx$ ,  $LINx$ , and  $EN$  inputs. The upper pair of waveforms (Example A) shows input signal duration ( $t_{INPUT}$ ) much longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between the input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ). The lower pair of waveforms (Example B) shows an input signal time ( $t_{INPUT}$ ) slightly longer than input filter time ( $t_{FLTIN}$ ); it is approximately the same duration between input signal time ( $t_{INPUT}$ ) and the output signal time ( $t_{OUTPUT}$ ).

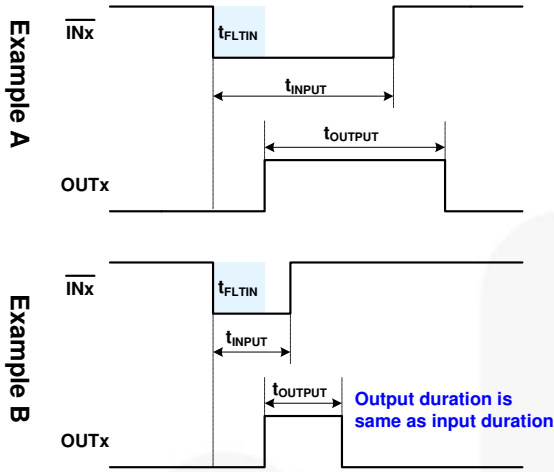

Figure 44. Input Noise Filter Definition

**3.2. Short-Pulsed Input Noise Rejection Method**

The input filter circuitry provides protection against short-pulsed input signals (  $HINx$  ,  $LINx$  , and  $EN$  ) on the input signal lines by applied noise signal.

If the input signal duration is less than input filter time ( $t_{FLTIN}$ ), the output does not change states.

Example A and B of the Figure 45 show the input and output waveforms with short-pulsed noise spikes with a duration less than input filter time; the output does not change states.

Figure 45. Noise Rejecting Input Filter Definition

Figure 46 shows the characteristics of the input filters while receiving narrow ON and OFF pulses. If input signal pulse duration,  $PW_{IN}$ , is less than input filter time,  $t_{FLTIN}$ ; the output pulse,  $PW_{OUT}$ , is zero. The input signal is rejected by input filter. Once the input signal pulse duration,  $PW_{IN}$ , exceeds input filter time,  $t_{FLTIN}$ , the output pulse durations,  $PW_{OUT}$ , matches the input pulse durations,  $PW_{IN}$ . FAN73894 input filter time,  $t_{FLTIN}$ , is about 250 ns for the high- and low-side outputs.

Figure 46. Input Filter Characteristic of Narrow ON

### DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. TO OBTAIN THE LATEST, MOST UP-TO-DATE DATASHEET AND PRODUCT INFORMATION, VISIT OUR WEBSITE AT [HTTP://WWW.FAIRCHILDSEMI.COM](http://www.fairchildsemi.com). FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

### AUTHORIZED USE

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

### ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

### PRODUCT STATUS DEFINITIONS

#### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
