1.2 Description

ESP32-S3-MINI-1 and ESP32-S3-MINI-1U are two powerful, generic Wi-Fi + Bluetooth LE MCU modules that feature a rich set of peripherals, yet an optimized size. They are an ideal choice for a wide variety of application scenarios related to Internet of Things (IoT), such as embedded systems, smart home, wearable electronics, etc.

ESP32-S3-MINI-1 comes with a PCB antenna. ESP32-S3-MINI-1U comes with a connector for an external antenna. They feature an up to 8 MB SPI flash and an optional 2 MB SPI Pseudo static RAM (PSRAM). Both ESP32-S3-MINI-1 and ESP32-S3-MINI-1U come in two versions, with the ordering code ending with -N8 and -N4R2 respectively. The two versions only vary in flash and PSRAM size.

The series comparison for the two modules is as follows:

Table 1: ESP32-S3-MINI-1 and ESP32-S3-MINI-1U Series Comparison

| Ordering Code | Flash ¹ | PSRAM ¹ | Ambient Temp. ² (°C) | Size ³ (mm) |
|------------------------------------|--------------------|--------------------|------------------------------------|---------------------------|
| ESP32-S3-MINI-1-N8 | 8 MB (Quad SPI) | - | -40 ~ 85 | 15.4 × 20.5 × 2.4 |
| ESP32-S3-MINI-1-N4R2 ⁴ | 4 MB (Quad SPI) | 2 MB (Quad SPI) | | |
| ESP32-S3-MINI-1U-N8 | 8 MB (Quad SPI) | - | | 15.4 × 15.4 × 2.4 |
| ESP32-S3-MINI-1U-N4R2 ⁴ | 4 MB (Quad SPI) | 2 MB (Quad SPI) | | |

¹ The modules use flash and PSRAM integrated in the chip's package.

² Ambient temperature specifies the recommended temperature range of the environment immediately outside the Espressif module.

³ For details, refer to Section [7.1 Physical Dimensions](#).

⁴ The ESP32-S3FH4R2 chip is not yet in mass production, so modules embedded with this chip are still in sample status.

At the core of the modules is an ESP32-S3, an Xtensa® 32-bit LX7 CPU that operates at up to 240 MHz. You can power off the CPU and make use of the low-power co-processor to constantly monitor the peripherals for changes or crossing of thresholds.

ESP32-S3 integrates a rich set of peripherals including SPI, LCD, Camera interface, UART, I2C, I2S, remote control, pulse counter, LED PWM, USB Serial/Jtag, MCPWM, SDIO host, GDMA, TWAI® controller (compatible with ISO 11898-1, i.e., CAN Specification 2.0), ADC, touch sensor, temperature sensor, timers and watchdogs, as well as up to 45 GPIOs. It also includes a full-speed USB 2.0 On-The-Go (OTG) interface to enable USB communication.

3.3 Strapping Pins

Note:

The content below is excerpted from [ESP32-S3 Series Datasheet](#) > Section *Strapping Pins*. For the strapping pin mapping between the chip and modules, please refer to Chapter 5 *Module Schematics*.

At each startup or reset, a module requires some initial configuration parameters, such as in which boot mode to load the module, voltage of flash memory, etc. These parameters are passed over via the strapping pins. After reset, the strapping pins operate as regular IO pins.

The parameters controlled by the given strapping pins at module reset are as follows:

- **Chip boot mode** – GPIO0 and GPIO46
- **VDD_SPI voltage** – GPIO45
- **ROM messages printing** – GPIO46
- **JTAG signal source** – GPIO3

GPIO0, GPIO45, and GPIO46 are connected to the chip's internal weak pull-up/pull-down resistors at chip reset. These resistors determine the default bit values of the strapping pins. Also, these resistors determine the bit values if the strapping pins are connected to an external high-impedance circuit.

Table 3: Default Configuration of Strapping Pins

| Strapping Pin | Default Configuration | Bit Value |
|---------------|-----------------------|-----------|
| GPIO0 | Pull-up | 1 |
| GPIO3 | Floating | – |
| GPIO45 | Pull-down | 0 |
| GPIO46 | Pull-down | 0 |

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP32-S3 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IO pins after reset.

Regarding the timing requirements for the strapping pins, there are such parameters as *setup time* and *hold time*. For more information, see Table 4 and Figure 4.

Table 4: Description of Timing Parameters for the Strapping Pins

| Parameter | Description | Min (ms) |
|-----------|---|----------|
| t_{SU} | <i>Setup time</i> is the time reserved for the power rails to stabilize before the CHIP_PU pin is pulled high to activate the chip. | 0 |
| t_H | <i>Hold time</i> is the time reserved for the chip to read the strapping pin values after CHIP_PU is already high and before these pins start operating as regular IO pins. | 3 |

**Figure 4: Visualization of Timing Parameters for the Strapping Pins**

3.3.1 Chip Boot Mode Control

GPIO0 and GPIO46 control the boot mode after the reset is released. See [Table 5 Chip Boot Mode Control](#).

Table 5: Chip Boot Mode Control

| Boot Mode | GPIO0 | GPIO46 |
|----------------------------------|-------------|---------------|
| Default Configuration | 1 (Pull-up) | 0 (Pull-down) |
| SPI Boot (default) | 1 | Any value |
| Download Boot | 0 | 0 |
| Invalid combination ¹ | 0 | 1 |

¹ This combination triggers unexpected behavior and should be avoided.

3.3.2 VDD_SPI Voltage Control

Depending on the value of EFUSE_VDD_SPI_FORCE, the voltage can be controlled in two ways.

Table 6: VDD_SPI Voltage Control

| EFUSE_VDD_SPI_FORCE | GPIO45 | eFuse ¹ | Voltage | VDD_SPI power source ² |

| | | 1 | 3.3 V | VDD3P3_RTC via R _{SPI} |

¹ eFuse: EFUSE_VDD_SPI_TIEH

² See [ESP32-S3 Series Datasheet](#) > Section *Power Scheme*

3.3.3 ROM Messages Printing Control

During boot process the messages by the ROM code can be printed to:

- (Default) UART and USB Serial/JTAG controller.
- USB Serial/JTAG controller.
- UART.

The ROM messages printing to UART or USB Serial/JTAG controller can be respectively disabled by configuring registers and eFuse. For detailed information, please refer to [ESP32-S3 Technical Reference Manual](#) > Chapter *Chip Boot Control*.

3.3.4 JTAG Signal Source Control

The strapping pin GPIO3 can be used to control the source of JTAG signals during the early boot process. This pin does not have any internal pull resistors and the strapping value must be controlled by the external circuit that cannot be in a high impedance state.

As Table 7 shows, GPIO3 is used in combination with EFUSE_DIS_PAD_JTAG, EFUSE_DIS_USB_JTAG, and EFUSE_STRAP_JTAG_SEL.

Table 7: JTAG Signal Source Control

¹ Current consumption when all peripheral clocks are **disabled**.

² Current consumption when all peripheral clocks are **enabled**. In practice, the current consumption might be different depending on which peripherals are enabled.

³ In Modem-sleep mode, Wi-Fi is clock gated, and the current consumption might be higher when accessing flash. For a flash rated at 80 Mbit/s, in SPI 2-line mode the consumption is 10 mA.

Table 13: Current Consumption in Low-Power Modes

| Work mode | Description | Typ (μ A) |
|--------------------------|---|----------------|
| Light-sleep ¹ | VDD_SPI and Wi-Fi are powered down, and all GPIOs are high-impedance. | 240 |
| Deep-sleep | RTC memory and RTC peripherals are powered up. | 8 |
| | RTC memory is powered up. RTC peripherals are powered down. | 7 |

| | | |
|-----------|---|---|
| Power off | CHIP_PU is set to low level. The chip is shut down. | 1 |
|-----------|---|---|

¹ In Light-sleep mode, all related SPI pins are pulled up. For chips embedded with PSRAM, please add corresponding PSRAM consumption values, e.g., 140 μ A for 8 MB 8-line PSRAM (3.3 V), 200 μ A for 8 MB 8-line PSRAM (1.8 V) and 40 μ A for 2 MB 4-line PSRAM (3.3 V).

5 Module Schematics

This is the reference design of the module.

6 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

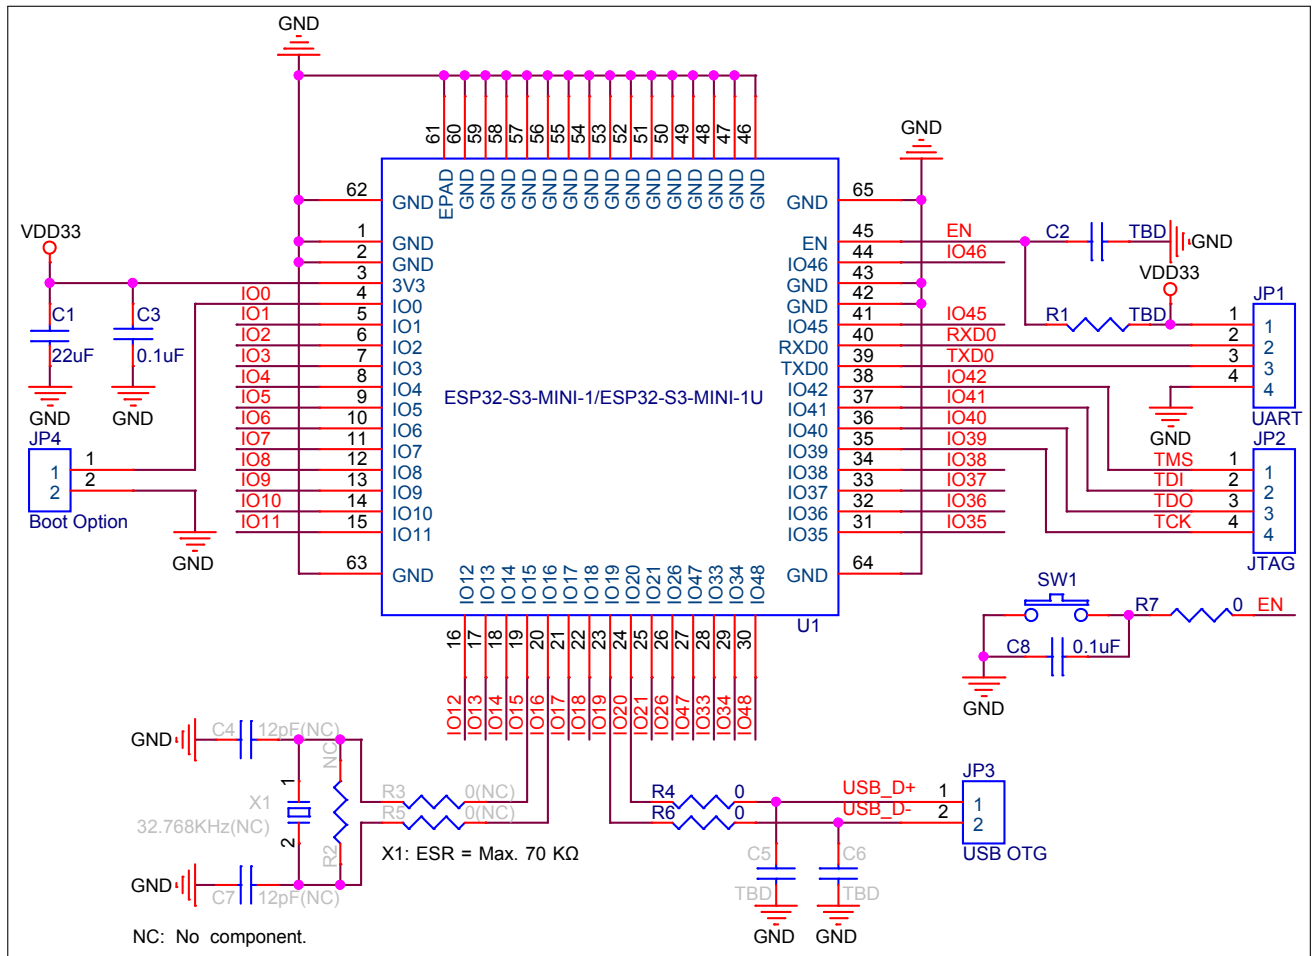

Figure 7: Peripheral Schematics

- Soldering the EPAD to the ground of the base board is not a must, however, it can optimize thermal performance. If you choose to solder it, please apply the correct amount of soldering paste. Too much soldering paste may increase the gap between the module and the baseboard. As result, the adhesion between other pins and the baseboard may be poor.
- To ensure that the power supply to the ESP32-S3 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually $R = 10\text{ k}\Omega$ and $C = 1\ \mu\text{F}$. However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-S3's power-up and reset sequence timing diagram, please refer to [ESP32-S3 Series Datasheet](#) > Section *Power Supply*.

8 Product Handling

8.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of $< 40\text{ }^{\circ}\text{C}$ and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions $25\pm 5\text{ }^{\circ}\text{C}$ and 60%RH. If the above conditions are not met, the module needs to be baked.

8.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
