

NCP3418, NCP3418A

Dual Bootstrapped 12 V MOSFET Driver with Output Disable

The NCP3418 and NCP3418A are dual MOSFET gate drivers optimized to drive the gates of both high-side and low-side power MOSFETs in a synchronous buck converter. Each of the drivers is capable of driving a 3000 pF load with a 25 ns propagation delay and a 20 ns transition time.

With a wide operating voltage range, high or low side MOSFET gate drive voltage can be optimized for the best efficiency. Internal, adaptive nonoverlap circuitry further reduces switching losses by preventing simultaneous conduction of both MOSFETs.

The floating top driver design can accommodate VBST voltages as high as 30 V, with transient voltages as high as 35 V. Both gate outputs can be driven low by applying a low logic level to the Output Disable (OD) pin. An Undervoltage Lockout function ensures that both driver outputs are low when the supply voltage is low, and a Thermal Shutdown function provides the IC with overtemperature protection. The NCP3418A is identical to the NCP3418 except that there is no internal charge pump diode.

The NCP3418 is pin-to-pin compatible with Analog Devices ADP3418 with the following advantages:

Features

- Faster Rise and Fall Times
- Internal Charge Pump Diode Reduces Cost and Parts Count
- Thermal Shutdown for System Protection
- Integrated OVP
- Internal Pulldown Resistor Suppresses Transient Turn On of Either MOSFET
- Anti Cross-Conduction Protection Circuitry
- Floating Top Driver Accommodates Boost Voltages of up to 30 V
- One Input Signal Controls Both the Upper and Lower Gate Outputs
- Output Disable Control Turns Off Both MOSFETs
- Complies with VRM 10.x Specifications
- Undervoltage Lockout
- Thermally Enhanced Package Available
- Pb-Free Packages are Available

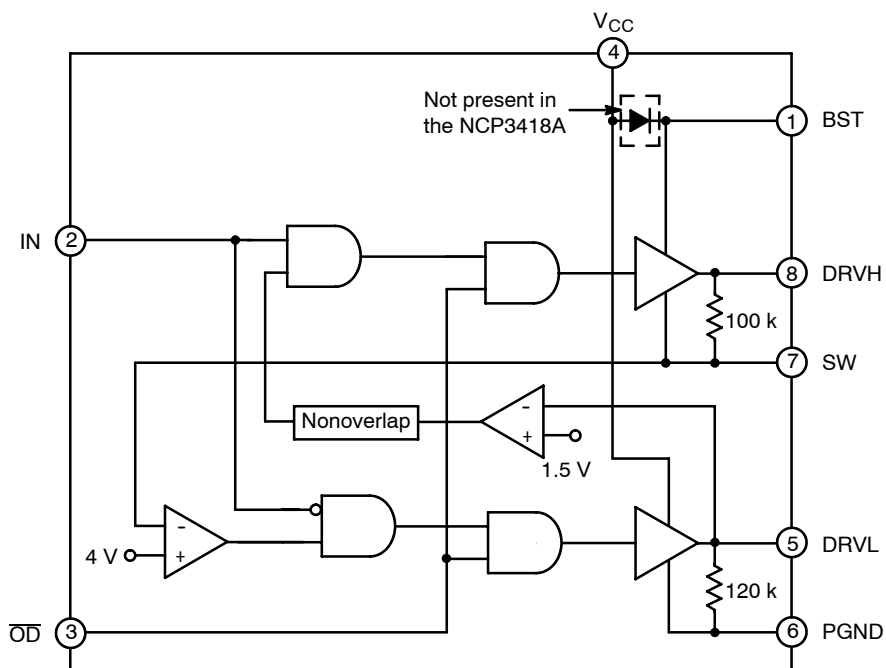

Figure 1. NCP3418/A Block Diagram

PIN DESCRIPTION

Pin	Symbol	Description
1	BST	Upper MOSFET Floating Bootstrap Supply. A capacitor connected between BST and SW pins holds this bootstrap voltage for the high-side MOSFET as it is switched. The recommended capacitor value is between 100 nF and 1.0 μ F. An external diode will be needed with the NCP3418A.
2	IN	Logic-Level Input. This pin has primary control of the drive outputs.
3	\overline{OD}	Output Disable. When low, normal operation is disabled forcing DRVH and DRVL low.
4	V _{CC}	Input Supply. A 1.0 μ F ceramic capacitor should be connected from this pin to PGND.
5	DRVL	Output drive for the lower MOSFET.
6	PGND	Power Ground. Should be closely connected to the source of the lower MOSFET.
7	SW	Switch Node. Connect to the source of the upper MOSFET.
8	DRVH	Output drive for the upper MOSFET.

APPLICATIONS INFORMATION

Theory of Operation

The NCP3418 and NCP3418A are single phase MOSFET drivers optimized for driving two N-channel MOSFETs in a synchronous buck converter topology. The NCP3418 features an internal diode, while the NCP3418A requires an external BST diode for the floating top gate driver. A single PWM input signal is all that is required to properly drive the high-side and the low-side MOSFETs. Each driver is capable of driving a 3.3 nF load at frequencies up to 500 kHz.

Low-Side Driver

The low-side driver is designed to drive a ground-referenced low $R_{DS(on)}$ N-Channel MOSFET. The voltage rail for the low-side driver is internally connected to the V_{CC} supply and PGND.

When the NCP3418 is enabled, the low-side driver's output is 180° out of phase with the PWM input. When the device is disabled, the low-side gate is held low.

High-Side Driver

The high-side driver is designed to drive a floating low $R_{DS(on)}$ N-channel MOSFET. The bias voltage for the high side driver is developed by a bootstrap circuit referenced to SW. The bootstrap capacitor should be connected between the BST and SW pins.

The bootstrap circuit comprises an internal or external diode, D1 (in which the anode is connected to V_{CC}), and an external bootstrap capacitor, C_{BST} . When the NCP3418 is starting up, the SW pin is at ground, so the bootstrap capacitor will charge up to V_{CC} through D1. When the PWM input goes high, the high-side driver will begin to turn on the high-side MOSFET by pulling charge out of C_{BST} . As the high-side MOSFET turns on, the SW pin will rise to V_{IN} , forcing the BST pin to $V_{IN} + V_{CC}$, which is enough gate-to-source voltage to hold the MOSFET on. To complete the cycle, the high-side MOSFET is switched off by pulling the gate down to the voltage at the SW pin. When low-side MOSFET turns on, the SW pin is held at ground. This allows the bootstrap capacitor to charge up to V_{CC} again.

The high-side driver's output is in phase with the PWM input. When the device is disabled, the high side gate is held low.

Safety Timer and Overlap Protection Circuit

The overlap protection circuit prevents both the high-side MOSFET and the low-side MOSFET from being on at the same time, and minimizes the associated off times. This will reduce power losses in the switching elements. The overlap protection circuit accomplishes this by controlling the delay from turning off the high-side MOSFET to turning on the low-side MOSFET.

To prevent cross conduction during the high-side MOSFET's turn-off and the low-side MOSFET's turn-on, the overlap circuit monitors the voltage at the SW pin. When the PWM input signal goes low, DRVH will go low after a propagation delay ($t_{pd}DRVH$), turning the high-side MOSFET off. However, before the low-side MOSFET can turn on, the overlap protection circuit waits for the voltage at the SW pin to fall below 4.0 V. Once SW falls below the 4.0 V

threshold, DRVL will go high after a propagation delay ($t_{pd}DRVL$), turning the low-side MOSFET on. However, if SW does not fall below 4.0 V in 300 ns, the safety timer circuit will override the normal control scheme and drive DRVL high. This will help insure that if the high-side MOSFET fails to turn off it will not produce an over-voltage at the output.

Similarly, to prevent cross conduction during the low-side MOSFET's turn-off and the high-side MOSFET's turn-on, the overlap circuit monitors the voltage at the gate of the low-side MOSFET through the DRVL pin. When the PWM signal goes high, DRVL will go low after a propagation delay ($t_{pd}DRVL$), turning the low-side MOSFET off. However, before the high-side MOSFET can turn on, the overlap protection circuit waits for the voltage at DRVL to drop below 1.5 V. Once this has occurred, DRVH will go high after a propagation delay ($t_{pd}DRVH$), turning the high-side MOSFET on.

Application Information

Supply Capacitor Selection

For the supply input (V_{CC}) of the NCP3418, a local bypass capacitor is recommended to reduce noise and supply peak currents during operation. Use a 1.0 to 4.7 μ F, low ESR capacitor. Multilayer ceramic chip (MLCC) capacitors provide the best combination of low ESR and small size. Keep the ceramic capacitor as close as possible to the V_{CC} and PGND pins.

Bootstrap Circuit

The bootstrap circuit uses a charge storage capacitor (C_{BST}) and the internal (or an external) diode. Selection of these components can be done after the high-side MOSFET has been chosen.

The bootstrap capacitor must have a voltage rating that is able to withstand twice the maximum supply voltage. A minimum 50 V rating is recommended. The capacitance is determined using the following equation:

$$C_{BST} = \frac{Q_{GATE}}{\Delta V_{BST}} \quad (\text{eq. 1})$$

where Q_{GATE} is the total gate charge of the high-side MOSFET, and ΔV_{BST} is the voltage droop allowed on the high-side MOSFET drive. For example, a NTD60N03 has a total gate charge of about 30 nC. For an allowed droop of 300 mV, the required bootstrap capacitance is 100 nF. A good quality ceramic capacitor should be used.

If an external Schottky diode will be used for bootstrap, it must be rated to withstand the maximum supply voltage plus any peak ringing voltages that may be present on SW. The average forward current can be estimated by:

$$I_{F(AVG)} = Q_{GATE} \times f_{MAX} \quad (\text{eq. 2})$$

where f_{MAX} is the maximum switching frequency of the controller. The peak surge current rating should be checked in-circuit, since this is dependent on the source impedance of the 12 V supply and the ESR of C_{BST} .

3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.004 IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSION D DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.006 PER SIDE. DIMENSION E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.010 mm PER SIDE.
5. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM. DIMENSIONS D AND E1 ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY AT DATUM H.
6. DATUMS A AND B ARE TO BE DETERMINED AT DATUM H.
7. DIMENSIONS b AND c APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 TO 0.25 FROM THE LEAD TIP.
8. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.

DIM	MILLIMETERS		
	MIN.	NOM.	MAX.
A	1.35	1.55	1.75
A1	---	0.05	0.10
A2	1.35	1.50	1.65
b	0.31	0.41	0.51
c	0.17	0.21	0.23
D	4.90 BSC		
E	6.00 BSC		
E1	3.90 BSC		
e	1.27 BSC		
F	2.24	2.72	3.20
F1	0.20 REF		
G	1.55	2.03	2.51
G1	0.46 REF		
h	0.25	0.38	0.50
L	0.40	0.84	1.27
L1	1.04 REF		
L2	0.25 REF		
∅	0°	4°	8°

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D."

GENERIC MARKING DIAGRAM*

XXXXXX = Specific Device Code
A = Assembly Location
Y = Year
WW = Work Week
▪ = Pb-Free Package

*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "▪", may or may not be present and may be in either location. Some products may not follow the Generic Marking.

DESCRIPTION:	SOIC-8 EP	PAGE 1 OF 1

onsemi and ONsemi are trademarks of Semiconductor Components Industries, LLC dba onsemi or its subsidiaries in the United States and/or other countries. onsemi reserves the right to make changes without further notice to any products herein. onsemi makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does onsemi assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. onsemi does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
