Description

The MAAL-011078 is a high dynamic range, single stage MMIC LNA with ultra low noise figure, high gain and excellent linearity. This amplifier is designed for operation from 700 MHz to 6 GHz and is housed in a lead-free 2 mm 8-lead PDFN plastic package.

This low noise amplifier has an integrated active bias circuit allowing direct connection to 3 V or 5 V bias and minimizing variations over temperature and process. The bias current is set by an external resistor, so the user can customize the power consumption to fit the application. V_{BIAS} can be utilized as an enable pin to power the device up and down during operation.

In the 50 Ω environment and at 3 V, the MAAL-011078 offers 0.5 dB noise figure at 2.6 GHz, with 22 dB of gain and over 33 dBm output third order intercept point (OIP3). It is ideal for 5G & 4G cellular infrastructure and Wi-Fi applications.

Absolute Maximum Ratings^{7,8,9}

Parameter	Absolute Maximum
RF Input Power CW	19 dBm
V_{DD}	6 V
V_{BIAS}	5 V
Storage Temperature	-55°C to $+150^{\circ}\text{C}$

7. Exceeding any one or combination of these limits may cause permanent damage to this device.

8. MACOM does not recommend sustained operation near these survivability limits.

9. Operating at nominal conditions with $T_J \leq 150^{\circ}\text{C}$ will ensure $\text{MTTF} > 1 \times 10^6$ hours.

10. Junction Temperature (T_J) = $T_C + \Theta_{JC} * ((V * I) - (P_{OUT} - P_{IN}))$

Typical thermal resistance (Θ_{JC}) = 83°C/W

a) For $T_C = +25^{\circ}\text{C}$,

$T_J = 33^{\circ}\text{C}$ @ 3 V, 0.05 A, $P_{OUT} = 17.5\text{ dBm}$, $P_{IN} = -4.5\text{ dBm}$

b) For $T_C = +85^{\circ}\text{C}$,

$T_J = 93^{\circ}\text{C}$ @ 3 V, 0.05 A, $P_{OUT} = 17.5\text{ dBm}$, $P_{IN} = -4.5\text{ dBm}$

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Biasing Options

The MAAL-011078 bias can be set in 2 different ways: using only V_{DD} or using separate V_{DD} and V_{BIAS} voltages. A separate V_{BIAS} voltage allows pin 5 (V_{BIAS}) to be used as an enable pin to power the device up and down during operation.

For both bias methods select the value of R_{BIAS} to achieve the desired current based on the tables on page 4, and use DC blocks at pin 2 (RF_{IN}) and pin 7 (RF_{OUT} / V_{DD}).

Biasing Option - V_{DD} only

To use only V_{DD} , connect pin 7 (RF_{OUT} / V_{DD}) to V_{DD} through an RF choke inductor and connect pin 5 (V_{BIAS}) to V_{DD} through bias resistor R_{BIAS} as shown in Figure 1.

Figure 1

Biasing Option - Separate V_{DD} and V_{BIAS} Voltages ($V_{BIAS} \leq V_{DD}$)

To use separate V_{DD} and V_{BIAS} voltages, connect pin 7 (RF_{OUT} / V_{DD}) to V_{DD} through an RF choke inductor and connect pin 5 (V_{BIAS}) to V_{BIAS} through bias resistor R_{BIAS} as shown in Figure 2. Typical current (I_{BIAS}) draw for pin 5 (V_{BIAS}) is 1.4 mA @ $V_{BIAS} = 3$ V and 1 μ A @ $V_{BIAS} = 0$ V. Typical current (I_{DD}) draw for pin 7 (RF_{OUT} / V_{DD}) is < 1 μ A @ $V_{BIAS} = 0$ V.
