

## Features

- Advanced Process Technology
- Logic Level Gate Drive
- Ultra Low On-Resistance
- 175°C Operating Temperature
- Fast Switching
- Repetitive Avalanche Allowed up to Tjmax
- Lead-Free, RoHS Compliant
- Automotive Qualified \*

# Description

Specifically designed for Automotive applications, this HEXFET® Power MOSFET utilizes the latest processing techniques to achieve extremely low on-resistance per silicon area. Additional features of this design are a 175°C junction operating temperature, fast switching speed and improved repetitive avalanche rating. These features combine to make this design an extremely efficient and reliable device for use in Automotive applications and wide variety of other applications.

#### Applications

- Electric Power Steering (EPS)
- Battery Switch
- Start/Stop Micro Hybrid
- Heavy Loads
- DC-DC Converter

#### **Absolute Maximum Ratings**

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only; and functional operation of the device at these or any other condition beyond those indicated in the specifications is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions. Ambient temperature (TA) is 25°C, unless otherwise specified.

Notes on Repetitive Avalanche Curves , Figures 14, 15: (For further info, see AN-1005 at www.irf.com)

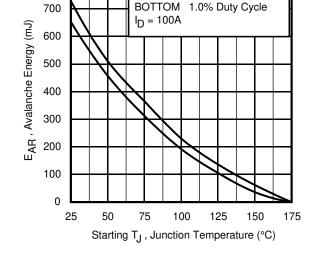

- Avalanche failures assumption: Purely a thermal phenomenon and failure occurs at a temperature far in excess of Tjmax. This is validated for every part type.
- 2. Safe operation in Avalanche is allowed as long as T<sub>jmax</sub> is not exceeded.
- 3. Equation below based on circuit and waveforms shown in Figures 23a, 23b.
- 4. PD (ave) = Average power dissipation per single avalanche pulse.
- 5. BV = Rated breakdown voltage (1.3 factor accounts for voltage increase during avalanche).
- 6. Iav = Allowable avalanche current.
- 7.  $\Delta T$  = Allowable rise in junction temperature, not to exceed T<sub>jmax</sub> (assumed as 25°C in Figure 13, 14).

tav = Average time in avalanche.

 $D = Duty cycle in avalanche = tav \cdot f$ 

ZthJC(D, tav) = Transient thermal resistance, see Figures 13)

$$\begin{split} P_{D (ave)} &= 1/2 \; ( \; 1.3 \cdot BV \cdot I_{av} ) = \Delta T / \; Z_{thJC} \\ I_{av} &= 2\Delta T / \; [1.3 \cdot BV \cdot Z_{th}] \\ & E_{AS (AR)} = P_{D (ave)} \cdot t_{av} \end{split}$$

#### Notes:

- ① Calculated continuous current based on maximum allowable junction temperature. Bond wire current limit is 240A. Note that current limitations arising from heating of the device leads may occur with some lead mounting arrangements. (Refer to AN-1140)
- ② Repetitive rating; pulse width limited by max. junction temperature.
- (3) Limited by TJmax, starting TJ =  $25^{\circ}$ C, L = 0.146mH RG =  $50\Omega$ , IAS = 100A, VGS = 10V.
- ④ Isp  $\leq$  100A, di/dt  $\leq$  678A/µs, Vpp  $\leq$  V(BR)pss, Tj  $\leq$  175°C.
- (5) Pulse width  $\leq$  400µs; duty cycle  $\leq$  2%.

- O Coss eff. (ER) is a fixed capacitance that gives the same energy as Coss while VDs is rising from 0 to 80% VDss.
- When mounted on 1" square PCB (FR-4 or G-10 Material). For recommended footprint and soldering techniques refer to application note #AN-994.
- ⑨ R<sub>θ</sub> is measured at T<sub>J</sub> approximately 90°C.
- Pulse drain current is limited to 1200A by source bonding technology
