

## **TLV61048EVM User's Guide**

---

---

---

The TLV61048EVM-042 evaluates the performance of the TLV61048. The TLV61048 is a non-synchronous boost converter to support up to 14-V output voltage from input ranging from 2.65 V to 5.5 V. The device integrates a 14-V power switch with 3.7-A typical current limit and operates at 600-KHz or, 1-MHz by configuring the FREQ pin. This user's guide describes the setup, schematic, bill of materials (BOM), and the PCB layout of the evaluation board.

## 1 Introduction

### 1.1 Performance

**Table 1** provides a summary of the TLV61048EVM performance characteristics, tested at 25°C ambient temperature.

**Table 1. EVM Characteristics**

	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Input voltage, $V_{power}$	The voltage in VIN pin is 3.3V	1.2	2		V
Output voltage, $V_{OUT}$	$V_{power} > 2\text{ V}$ , $I_{OUT} \leq 200\text{mA}$		12		V
Output current, $I_{OUT}$	$V_{power} > 2\text{ V}$	200			mA

### 1.2 Modification

The EVM is designed to support some modifications by the user. The external components can be changed according to the real application.

The C6 is reserved for one cell super-capacitor, of which the voltage is normally from 1.2 V to 2.7 V. One typical application of the TLV61048 is to generate 12-V output from one cell super-capacitor. In such application, the VIN pin of TLV61048 should be powered by a typical 3.3-V external power supply.

To reduce the output ripple during stable and load transient condition, the C4 and C5 can be populated to increase the output capacitor.

The feed-forward capacitor C8 can help to improve the response performance and the phase margin if the value is properly selected. Refer to this application note to select the feed-forward capacitor if required.

[Feedforward Capacitor Makes Boost Converter Fast and Stable.](#)

## 2 Setup

The function of connectors on the TLV61048EVM-042 and their setup is described below:

<b>J1-VPS</b>	Positive output of the power supply for the TLV61048EVM.
<b>J2-VOUT</b>	Positive connection for the loading.
<b>J3-GND</b>	Return connection of the power supply for the TLV61048EVM.
<b>J4-GND</b>	Return connection for the loading.
<b>J5-VPS_S</b>	power supply sensing for measuring efficiency. VPS_S and GND_S are for positive and negative inputs of the voltage meter.
<b>J6-VOUT_S</b>	Output voltage sensing for measuring efficiency. VOUT_S and GND_S are for positive and negative inputs of the voltage meter.
<b>J7-VIN</b>	Select the voltage source for the VIN pin of the TLV61048. if short the VIN to VPS, The power supply for the EVM must be higher than 2.6 V. if support the VIN with an additional 3.3-V voltage source, the power supply connected to the VPS can be down to 1.2V.
<b>J8-EN</b>	Control the EN pin to enable or disable the TLV61048.
<b>J9-FREQ</b>	The device switches with 600-KHz frequency if the FREQ pin is floating, and with 1-MHz if the FREQ is shorted to GND.

### 3 Schematic and Bill of Materials and PCB Layout

This section provides the TLV61048EVM-042 schematic, bill of materials (BOM), and PCB board layout.

#### 3.1 Schematic

Figure 1 shows the EVM schematic.

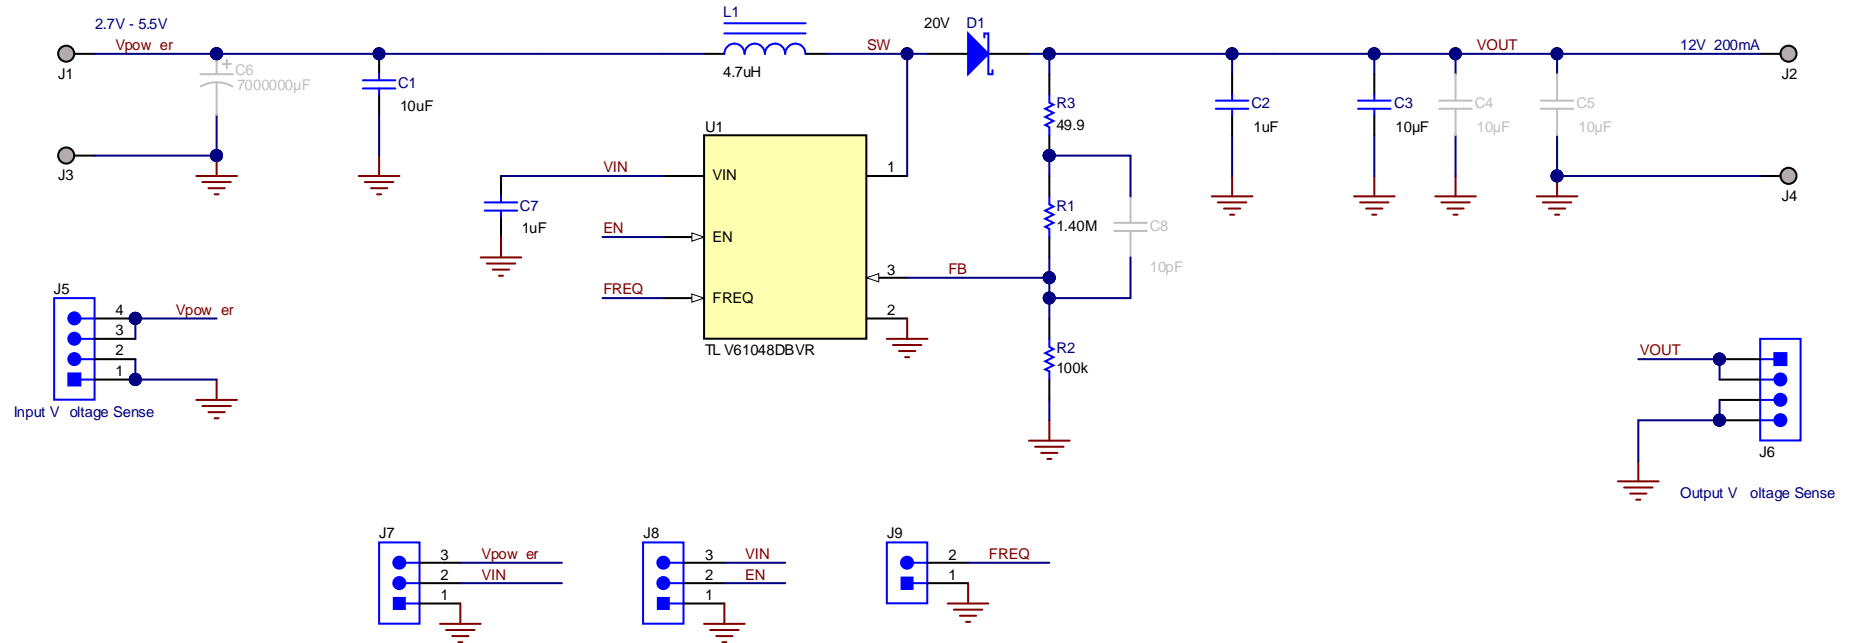

Figure 1. TLV61048EVM-042 Schematic

### 3.2 Bill of Materials

Table 2 displays the EVM bill of materials.

**Table 2. TLV61048EVM-042 Bill of Materials**

Designator	Qty	Value	Description	PackageReference	PartNumber	Manufacturer
C1	1	10uF	CAP, CERM, 10 uF, 25 V, +/- 20%, X5R, 0603	0603	GRM188R61E106MA73D	MuRata

### 3.3 PCB Layout

The PCB of the TLV61048EVM has two layers. All the components are in the top layer. [Figure 2](#) shows the top layout and components location. [Figure 3](#) shows the bottom layer.
