524288-word × 8-bit CMOS UV Erasable and Programmable ROM

HITACHI

Description

The Hitachi HN27C4001G is a 4-Mbit ultraviolet erasable and electrically programmable ROM, featuring high speed and low power dissipation. Fabricated on advanced fine process and high speed circuitry technique, the HN27C4001G makes high speed access time possible. Therefore, it is suitable for high speed microcomputer systems. The HN27C4001G offers high speed programming using page programming mode.

Features

High speed

Access time: 100 ns/120 ns/150 ns (max)

Low power dissipation
 Standby mode: 5 μW(typ)

Active mode: 35 mW/MHz (typ)

Fast high reliability page programming and fast high-reliability programming

Programming voltage: +12.5 V D.C.

Program time: 3.5 sec (min) (Theoretical in page programming)

Inputs and outputs TTL compatible during both read and program modes

Fast High-Reliability Page Programming

This device can be applied the high performance page programming algorithm shown in the following flowchart. This algorithm allows to obtain faster programming time without any voltage stress to the device nor deterioration in reliability of programmed data.

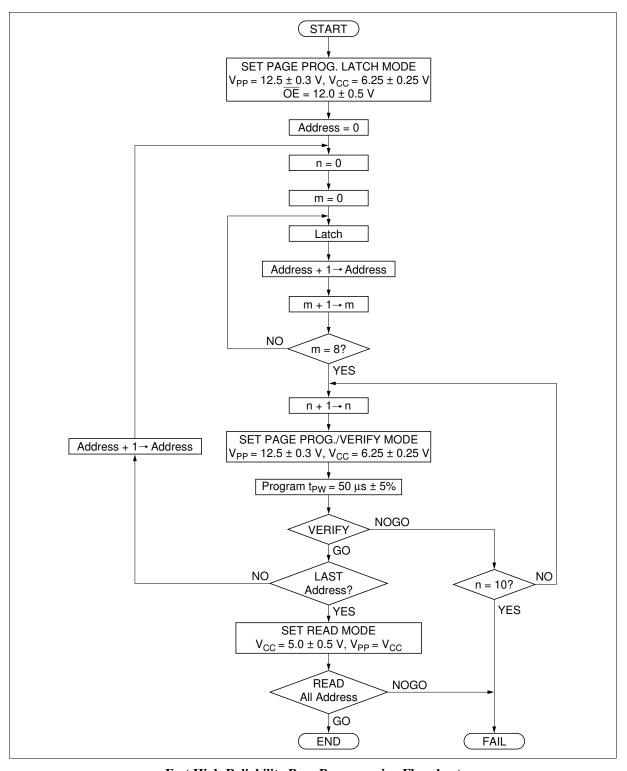

Page Program Set

Apply 12 V to \overline{OE} pin after applying 12.5 V to V_{PP} to set a page program mode.

The device operates in a page program mode until reset.

Page Program Reset

Set V_{PP} to V_{CC} level or less to reset a page program mode.

Optional Page Programming

This device can be applied the optional page programming algorithm shown in the following flowchart. This algorithm allows to obtain faster programming time without any voltage stress to the device nor deterioration in reliability of programmed data.

This programming algorithm is the combination of page programming and byte verify. It can avoid the increase of programming verify time when a programmer with slow machine cycle is used, and shorten the total programming time.

Regarding the timing specifications for page programming and byte verify, please refer to the specifications for fast high-reliability page programming and fast high-reliability programming.

Erase

Erasure of HN27C4001G is performed by exposure to ultraviolet light of 2537 Å and all the output data are changed to "1" after this erasure procedure. The minimum integrated dose (i.e. UV intensity x exposure time) for erasure is $15 \text{ W} \cdot \text{sec/cm}^2$.

Mode Description

Device Identifier Mode

The device identifier mode allows the reading out of binary codes that identify manufacturer and type of device, from outputs of EPROM. By this mode, the device will be automatically matched its own corresponding programming algorithm, using programming equipment.
