Functional Diagram

General Description

The HMC566LP4E is a high dynamic range GaAs pHEMT MMIC Low Noise Amplifier (LNA) in a 4x4 mm SMT package which operates from 28 to 36 GHz. The HMC566LP4E provides 21 dB of small signal gain, 2.8 dB of noise figure and output IP3 of 24 dBm. This self-biased LNA is ideal for hybrid and MCM assemblies due to its compact size, single +3V supply operation, and DC blocked RF I/O's. The RoHS packaged HMC566LP4E eliminates the need for wirebonding and allows the use of high volume surface mount manufacturing techniques. The HMC566LP4E is also available in chip form as the HMC566.

[2] Circuit Board Material: Rogers 4350 or Arlon 25 FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and package bottom should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.
