Hex D-Type Flip Flop with Clear

Note: xxxFN (JEDEC SOP) is not available in Japan.

The TC74VHC174 is an advanced high speed CMOS HEX D-TYPE FLIP FLOP fabricated with silicon gate C^2MOS technology.

It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

Information signals applied to D inputs are transferred to the Q output on the positive going edge of the clock pulse.

When the $\overline{CLR}$ input is held low, the Q output are in the low logic level independent of the other inputs.

An input protection circuit ensures that 0 to 5.5 V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5 to 3 V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

Note 2: C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation:

$$I_{CC\ (opr)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/6 \text{ (per F/F)}$$

And the total C_{PD} when n pcs. of flip flop operate can be gained by the follwing eguation:

$$C_{PD} \text{ (total)} = 19 + 10 \cdot n$$
