МAXIM

White LED 1x/1.5x Charge Pump in UCSP and Thin QFN

MAX1573

_____General Description

The MAX1573 fractional charge pump drives up to four white LEDs with regulated constant current for uniform intensity. By utilizing proprietary adaptive 1x/1.5x modes and ultra-low-dropout current regulators, it maintains the highest possible efficiency over the full 1-cell Li+ battery input voltage range. The 1MHz fixed-frequency switching allows for tiny external components and the regulation scheme is optimized to ensure low EMI and low input ripple.

An external resistor sets the full-scale LED current, while two digital inputs control on/off and select amongst three levels of brightness. A pulse-width modulation (PWM) signal can also be used to modulate LED brightness, requiring no additional components.

The MAX1573 is available in the tiny chip-scale UCSP™ (4 x 4 grid) and 16-pin thin QFN packages.

_____Applications

Cell Phones, Smart Phones

PDAs, Digital Cameras, Camcorders

MP3 Players
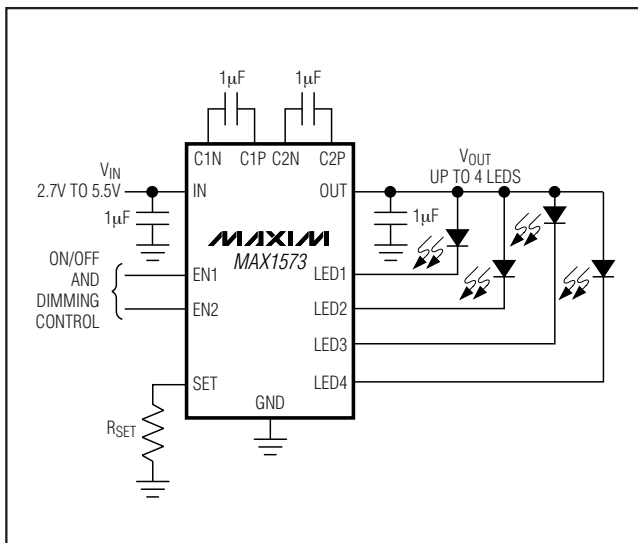

Other Handhelds with Color Displays

_____Features

♦ **Proprietary Adaptive 1x/1.5x Modes**

♦ **High Efficiency (P$_{LEDs}$/P$_{BATT}$), Up to 92%**

♦ **0.2% LED Current Matching**

♦ **28mA/LED Drive Capability**

♦ **Low Input Ripple and EMI**

♦ **Eliminates Ballast Resistors**

♦ **Logic or PWM Dimming Control**

♦ **Low 0.1µA Shutdown Current**

♦ **2.7V to 5.5V Input Voltage Range**

♦ **Soft-Start Limits Inrush Current**

♦ **Output Overvoltage Protection**

♦ **Thermal Shutdown Protection**

♦ **No External Schottky Diode Required**

♦ **Tiny UCSP (2.1mm x 2.1mm x 0.6mm) and Thin QFN (4mm x 4mm) Packages**

_____Ordering Information

_____Block Diagram

MAXIM
MAX1573

_____Detailed Description

The MAX1573 is a complete charge-pump buck-boost converter requiring only four small ceramic capacitors.

The MAX1573 utilizes a proprietary 1x/1.5x fractional charge-pump topology to drive up to four white LEDs with regulated constant current for uniform intensity. The MAX1573 operates with a 1MHz fixed frequency. An external resistor (R_{SET}) programs the full-scale LED current, while two digital inputs control on/off and provide brightness control.

Output Regulation

The MAX1573 operates in 1x mode until just above dropout. Then the MAX1573 switches to 1.5x charge-pump mode to regulate the lowest of LED1–LED4 to 150mV and maintain constant LED brightness even at very low battery voltages. Using this topology, there is no LED brightness change during the 1x/1.5x switchover, which guarantees no flicker on the display. The switchover scheme has low hysteresis, minimizing operation in the less-efficient 1.5x mode. The 1x mode produces almost no ripple, while the 1.5x mode regulates the output voltage by controlling the rate at which the transfer capacitors are charged. In this way, the switching frequency remains constant for reduced input ripple and stable noise spectrum.

Soft-Start

The MAX1573 includes soft-start circuitry to limit inrush current at turn-on. When starting up with an output voltage that is not near the input voltage, the output capacitor is charged directly from the input with a DAC-ramped current source (with no charge-pump action) until the output voltage is near the input voltage. Once this occurs, the charge pump determines if 1x or 1.5x mode is required. In the case of 1x mode, the soft-start is terminated and normal operation begins. In the case of 1.5x mode, soft-start operates until the lowest of LED1–LED4 reaches regulation. If an overload condition occurs, soft-start repeats every 2.1ms. If the output is shorted to ground, the output current is limited by the MAX1573 fractional-switching technique.

MAX1573

True Shutdown™ Mode

When EN1 and EN2 are grounded, the MAX1573 is in shutdown, and the charge pump examines whether the input voltage is greater than or less than the output voltage and shorts the transfer capacitor nodes to either IN or OUT as necessary. The output is high impedance in either case.

Thermal Shutdown

The MAX1573 includes a thermal-limit circuit that shuts down the IC at about +160°C. Turn-on occurs after the IC cools by approximately 20°C.

Setting the Output Current

SET controls the LED bias current. Current flowing into LED1, LED2, LED3, and LED4 is a multiple of the current flowing out of SET. Set the output current as follows:

$$I_{LED\_} = K \times \left(\frac{0.6V}{R_{SET}} \right)$$

where K = 22, 66, or 219 (depending upon EN1 and EN2, see Table 1), and R$_{SET}$ is the resistor connected between SET and GND (see the *Typical Operating Circuit*).

Table 1. EN1/EN2 States

EN1/EN2 STATES	BRIGHTNESS	LED CURRENT
EN1 = low, EN2 = low	Shutdown	I$_{LED}$ = 0
EN1 = low, EN2 = high	1/10 Brightness	I$_{LED}$ = 22 x I$_{SET}$
EN1 = high, EN2 = low	3/10 Brightness	I$_{LED}$ = 66 x I$_{SET}$
EN1 = high, EN2 = high	Full Brightness	I$_{LED}$ = 219 x I$_{SET}$

*True Shutdown is a trademark of Maxim Integrated Products, Inc.*

Applications Information

Dimming Using EN1 and EN2

Use EN1 and EN2 inputs as a digital 2-bit number to control on/off, 1/10, 3/10, and full current (see Table 1). R$_{SET}$ programs the full current level (see the *Setting the Output Current* section).

Dimming Using PWM into EN1

Use EN2 for shutdown and drive EN1 with a PWM signal. Current can be varied from 1/10 to full. The waveforms in the *Typical Operating Characteristics* show the response time of dimming. EN2 keeps the part on, eliminating any soft-start delay that would impede PWM control, allowing a PWM frequency up to 50kHz (Figure 1).

Dimming Using a Filtered PWM Signal

Use a high-frequency PWM signal to drive an R-C-R filter on the SET pin (Figure 2). A 0% PWM duty cycle corresponds to 18.7mA/LED, while a 100% PWM duty cycle corresponds to 0mA/LED. At PWM frequencies above 5kHz, C3 may be reduced.

Input Ripple

For LED drivers, input ripple is more important than output ripple. Input ripple depends on the source supply's impedance. Adding a lowpass filter to the input further reduces input ripple. Figure 3 shows a C-R-C filter used to reduce input ripple to less than 2mV$_{P-P}$ when driving a 75mA load. Alternately, increasing C$_{IN}$ to 2.2µF or 4.7µF yields input ripple of 17mV$_{P-P}$ or 9mV$_{P-P}$, respectively, with only a small increase in footprint. The 1x mode always has very low input ripple.

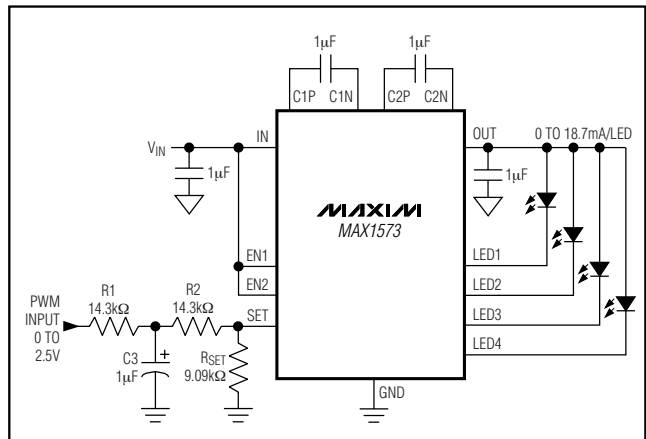

Figure 1. Dimming Using PWM Signal into EN1

Figure 2. Dimming Using Filtered PWM Signal

MAXIM

PC Board Layout and Routing

The MAX1573 is a high-frequency switched-capacitor voltage regulator. For best circuit performance, use a solid ground plane and place C_{IN} and C_{OUT} as close to the MAX1573 as possible. Also, place their ground pads close together and as close as possible to GND. See the MAX1573 EV kit for an example.

Component Selection

Use ceramic capacitors with an X5R dielectric or better temperature coefficient. The transfer capacitors may be reduced in value if the input voltage does not fall below 3.4V, if only two or three LEDs are used, or if four LEDs are used at 10mA or less. Some typical external component values are shown in Table 2.

Under normal operating conditions, power dissipation is low. Maximum power dissipation occurs at an input voltage of 4.2V and all four LEDs (with V_F = 4V) are driven with 30mA per LED. The power is calculated as:

$$P_D = [(1.5 \times V_{IN}) - V_F] \times 120mA = 276mW$$

At higher input voltages, the MAX1573 switches to 1x mode and power dissipation decreases.

Figure 3. C-R-C Filter Reduces Input Ripple
